The babel package is being developed incrementally, which means parts of the code are under development and therefore incomplete. Only documented features are considered complete. In other words, use babel in real documents only as documented (except, of course, if you want to explore and test them).

## 1. Identification and loading of required files

The babel package after unpacking consists of the following files:

**babel.sty** is the  $\text{\LaTeX}$  package, which set options and load language styles.

**babel.def** is loaded by Plain.

**switch.def** defines macros to set and switch languages (it loads part babel.def).

**plain.def** is not used, and just loads babel.def, for compatibility.

**hyphen.cfg** is the file to be used when generating the formats to load hyphenation patterns.

There some additional tex, def and lua files.

The babel installer extends docstrip with a few “pseudo-guards” to set “variables” used at installation time. They are used with `<@name@>` at the appropriate places in the source code and defined with either `<<name=value>>`, or with a series of lines between `<<*name>>` and `<</name>>`. The latter is cumulative (e.g., with *More package options*). That brings a little bit of literate programming. The guards `<-name>` and `<+name>` have been redefined, too. See babel.ins for further details.

## 2. locale directory

A required component of babel is a set of ini files with basic definitions for about 300 languages. They are distributed as a separate zip file, not packed as dtx. Many of them are essentially finished (except bugs and mistakes, of course). Some of them are still incomplete (but they will be usable), and there are some omissions (e.g., there are no geographic areas in Spanish). Not all include LICR variants.

babel-\*.ini files contain the actual data; babel-\*.tex files are basically proxies to the corresponding ini files.

See [Keys in ini files](#) in the the babel site.

## 3. Tools

```
1 <<version=24.14.71672>>
2 <<date=2024/12/16>>
```

**Do not use the following macros in ldf files. They may change in the future.** This applies mainly to those recently added for replacing, trimming and looping. The older ones, like `\bbl@afterfi`, will not change. We define some basic macros which just make the code cleaner. `\bbl@add` is now used internally instead of `\addto` because of the unpredictable behavior of the latter. Used in babel.def and in babel.sty, which means in  $\text{\LaTeX}$  is executed twice, but we need them when defining options and babel.def cannot be load until options have been defined. This does not hurt, but should be fixed somehow.

```
3 <<*Basic macros>> ≡
4 \bbl@trace{Basic macros}
5 \def\bbl@stripslash{\expandafter\@gobble\string}
6 \def\bbl@add#1#2{%
7   \bbl@ifunset{\bbl@stripslash#1}%
8   {\def#1{#2}}%
9   {\expandafter\def\expandafter#1\expandafter{#1#2}}
10 \def\bbl@xin@{\@expandtwoargs\in@}
11 \def\bbl@carg#1#2{\expandafter#1\csname#2\endcsname}%
12 \def\bbl@ncarg#1#2#3{\expandafter#1\expandafter#2\csname#3\endcsname}%
13 \def\bbl@ccarg#1#2#3{%
14   \expandafter#1\csname#2\expandafter\endcsname\csname#3\endcsname}%
15 \def\bbl@carg#1#2{\expandafter#1\csname bbl@#2\endcsname}%
16 \def\bbl@cs#1{\csname bbl@#1\endcsname}
17 \def\bbl@c#1{\csname bbl@#1\language\endcsname}
18 \def\bbl@loop#1#2#3{\bbl@loop#1{#3}#2,\@nnil,}
19 \def\bbl@loopx#1#2{\expandafter\bbl@loop\expandafter#1\expandafter{#2}}
```

```

20 \def\bbl@loop#1#2#3,{%
21   \ifx\@nnil#3\relax\else
22     \def#1{#3}#2\bbl@afterfi\bbl@loop#1{#2}%
23   \fi}
24 \def\bbl@for#1#2#3{\bbl@loopx#1{#2}{\ifx#1\@empty\else#3\fi}}

```

**\bbl@add@list** This internal macro adds its second argument to a comma separated list in its first argument. When the list is not defined yet (or empty), it will be initiated. It presumes expandable character strings.

```

25 \def\bbl@add@list#1#2{%
26   \edef#1{%
27     \bbl@ifunset{\bbl@stripslash#1}%
28     }%
29     {\ifx#1\@empty\else#1,\fi}%
30   #2}}

```

### **\bbl@afterelse**

**\bbl@afterfi** Because the code that is used in the handling of active characters may need to look ahead, we take extra care to ‘throw’ it over the \else and \fi parts of an \if-statement<sup>1</sup>. These macros will break if another \if... \fi statement appears in one of the arguments and it is not enclosed in braces.

```

31 \long\def\bbl@afterelse#1\else#2\fi{\fi#1}
32 \long\def\bbl@afterfi#1\fi{\fi#1}

```

**\bbl@exp** Now, just syntactical sugar, but it makes partial expansion of some code a lot more simple and readable. Here \ stands for \noexpand, \< for \noexpand applied to a built macro name (which does not define the macro if undefined to \relax, because it is created locally), and \[. . .] for one-level expansion (where . . . is the macro name without the backslash). The result may be followed by extra arguments, if necessary.

```

33 \def\bbl@exp#1{%
34   \begingroup
35   \let\<\noexpand
36   \let\<\bbl@exp@en
37   \let\[\bbl@exp@ue
38   \edef\bbl@exp@aux{\endgroup#1}%
39   \bbl@exp@aux}
40 \def\bbl@exp@en#1>{\expandafter\noexpand\csname#1\endcsname}%
41 \def\bbl@exp@ue#1]{%
42   \unexpanded\expandafter\expandafter\expandafter{\csname#1\endcsname}}%

```

**\bbl@trim** The following piece of code is stolen (with some changes) from keyval, by David Carlisle. It defines two macros: \bbl@trim and \bbl@trim@def. The first one strips the leading and trailing spaces from the second argument and then applies the first argument (a macro, \toks@ and the like). The second one, as its name suggests, defines the first argument as the stripped second argument.

```

43 \def\bbl@tempa#1{%
44   \long\def\bbl@trim##1##2{%
45     \futurelet\bbl@trim@a\bbl@trim@c##2\@nil\@nil#1\@nil\relax{##1}}%
46   \def\bbl@trim@c{%
47     \ifx\bbl@trim@a\@sptoken
48       \expandafter\bbl@trim@b
49     \else
50       \expandafter\bbl@trim@b\expandafter#1%
51     \fi}%
52   \long\def\bbl@trim@b#1##1 \@nil{\bbl@trim@i##1}}
53 \bbl@tempa{ }
54 \long\def\bbl@trim@i#1\@nil#2\relax#3{#3{#1}}
55 \long\def\bbl@trim@def#1{\bbl@trim{\def#1}}

```

<sup>1</sup>This code is based on code presented in TUGboat vol. 12, no2, June 1991 in “An expansion Power Lemma” by Sonja Maus.

**\bbl@ifunset** To check if a macro is defined, we create a new macro, which does the same as `\ifundefined`. However, in an  $\epsilon$ -tex engine, it is based on `\ifcurname`, which is more efficient, and does not waste memory. Defined inside a group, to avoid `\ifcurname` being implicitly set to `\relax` by the `\curname` test.

```

56 \begingroup
57 \gdef\bbl@ifunset#1{%
58   \expandafter\ifx\curname#1\endcurname\relax
59   \expandafter\@firstoftwo
60   \else
61   \expandafter\@secondoftwo
62   \fi}
63 \bbl@ifunset{ifcurname}%
64 {}%
65 {\gdef\bbl@ifunset#1{%
66   \ifcurname#1\endcurname
67   \expandafter\ifx\curname#1\endcurname\relax
68   \bbl@afterelse\expandafter\@firstoftwo
69   \else
70   \bbl@afterfi\expandafter\@secondoftwo
71   \fi
72   \else
73   \expandafter\@firstoftwo
74   \fi}}
75 \endgroup

```

**\bbl@ifblank** A tool from url, by Donald Arseneau, which tests if a string is empty or space. The companion macros tests if a macro is defined with some ‘real’ value, i.e., not `\relax` and not empty,

```

76 \def\bbl@ifblank#1{%
77   \bbl@ifblank@i#1\@nil\@nil\@secondoftwo\@firstoftwo\@nil}
78 \long\def\bbl@ifblank@i#1#2\@nil#3#4#5\@nil{#4}
79 \def\bbl@ifset#1#2#3{%
80   \bbl@ifunset{#1}{#3}{\bbl@exp{\bbl@ifblank{\@nameuse{#1}}}{#3}{#2}}}

```

For each element in the comma separated `<key>=<value>` list, execute `<code>` with #1 and #2 as the key and the value of current item (trimmed). In addition, the item is passed verbatim as #3. With the `<key>` alone, it passes `\empty` (i.e., the macro thus named, not an empty argument, which is what you get with `<key>=` and no value).

```

81 \def\bbl@forkv#1#2{%
82   \def\bbl@kvcmd##1##2##3{#2}%
83   \bbl@kvnext#1,\@nil,}
84 \def\bbl@kvnext#1,{%
85   \ifx\@nil#1\relax\else
86   \bbl@ifblank{#1}{\bbl@forkv@eq#1=\@empty=\@nil{#1}}%
87   \expandafter\bbl@kvnext
88   \fi}
89 \def\bbl@forkv@eq#1=#2=#3\@nil#4{%
90   \bbl@trim\def\bbl@forkv@a{#1}%
91   \bbl@trim{\expandafter\bbl@kvcmd\expandafter{\bbl@forkv@a}}{#2}{#4}}

```

A *for* loop. Each item (trimmed) is #1. It cannot be nested (it’s doable, but we don’t need it).

```

92 \def\bbl@vforeach#1#2{%
93   \def\bbl@forcmd##1{#2}%
94   \bbl@fornext#1,\@nil,}
95 \def\bbl@fornext#1,{%
96   \ifx\@nil#1\relax\else
97   \bbl@ifblank{#1}{\bbl@trim\bbl@forcmd{#1}}%
98   \expandafter\bbl@fornext
99   \fi}
100 \def\bbl@foreach#1{\expandafter\bbl@vforeach\expandafter{#1}}

```

**\bbl@replace** Returns implicitly `\toks@` with the modified string.

```

101 \def\bbl@replace#1#2#3{% in #1 -> repl #2 by #3

```

```

102 \toks@{}%
103 \def\bbl@replace@aux##1#2##2#2{%
104   \ifx\bbl@nil##2%
105     \toks@\expandafter{\the\toks@##1}%
106   \else
107     \toks@\expandafter{\the\toks@##1#3}%
108     \bbl@afterfi
109     \bbl@replace@aux##2#2%
110   \fi}%
111 \expandafter\bbl@replace@aux#1#2\bbl@nil#2%
112 \edef#1{\the\toks@}%

```

An extension to the previous macro. It takes into account the parameters, and it is string based (i.e., if you replace elax by ho, then \relax becomes \rho). No checking is done at all, because it is not a general purpose macro, and it is used by babel only when it works (an example where it does *not* work is in \bbl@TG@@date, and also fails if there are macros with spaces, because they are retokenized). It may change! (or even merged with \bbl@replace; I'm not sure checking the replacement is really necessary or just paranoia).

```

113 \ifx\detokenize\undefined\else % Unused macros if old Plain TeX
114   \bbl@exp{\def\\bbl@parsedef##1\detokenize{macro:}}#2->#3\relax}%
115   \def\bbl@tempa{#1}%
116   \def\bbl@tempb{#2}%
117   \def\bbl@tempe{#3}%
118   \def\bbl@sreplace#1#2#3{%
119     \begingroup
120       \expandafter\bbl@parsedef\meaning#1\relax
121       \def\bbl@tempc{#2}%
122       \edef\bbl@tempc{\expandafter\strip@prefix\meaning\bbl@tempc}%
123       \def\bbl@tempd{#3}%
124       \edef\bbl@tempd{\expandafter\strip@prefix\meaning\bbl@tempd}%
125       \bbl@xin{\bbl@tempc}{\bbl@tempe}% If not in macro, do nothing
126       \ifin@
127         \bbl@exp{\\bbl@replace\\bbl@tempe{\bbl@tempc}{\bbl@tempd}}%
128         \def\bbl@tempc{      Expanded an executed below as 'uplevel'
129           \\makeatletter % "internal" macros with @ are assumed
130           \\scantokens{%
131             \bbl@tempa\\@namedef{\bbl@stripslash#1}\bbl@tempb{\bbl@tempe}}%
132             \catcode64=\the\catcode64\relax}% Restore @
133       \else
134         \let\bbl@tempc\empty % Not \relax
135       \fi
136       \bbl@exp{      For the 'uplevel' assignments
137       \endgroup
138       \bbl@tempc}} % empty or expand to set #1 with changes
139 \fi

```

Two further tools. \bbl@ifsamestring first expand its arguments and then compare their expansion (sanitized, so that the catcodes do not matter). \bbl@engine takes the following values: 0 is pdf<sub>La</sub>TeX, 1 is luatex, and 2 is xetex. You may use the latter it in your language style if you want.

```

140 \def\bbl@ifsamestring#1#2{%
141   \begingroup
142     \protected@edef\bbl@tempb{#1}%
143     \edef\bbl@tempb{\expandafter\strip@prefix\meaning\bbl@tempb}%
144     \protected@edef\bbl@tempc{#2}%
145     \edef\bbl@tempc{\expandafter\strip@prefix\meaning\bbl@tempc}%
146     \ifx\bbl@tempb\bbl@tempc
147       \aftergroup\@firstoftwo
148     \else
149       \aftergroup\@secondoftwo
150     \fi
151   \endgroup}
152 \chardef\bbl@engine=
153 \ifx\directlua\undefined
154   \ifx\XeTeXinputencoding\undefined

```

```

155     \z@
156   \else
157     \tw@
158   \fi
159 \else
160   \@ne
161 \fi

```

A somewhat hackish tool (hence its name) to avoid spurious spaces in some contexts.

```

162 \def\bbl@bsphack{%
163   \ifhmode
164     \hskip\z@skip
165   \def\bbl@esphack{\loop\ifdim\lastskip>\z@\unskip\repeat\unskip}%
166   \else
167     \let\bbl@esphack\@empty
168   \fi}

```

Another hackish tool, to apply case changes inside a protected macros. It's based on the internal `\let`'s made by `\MakeUppercase` and `\MakeLowercase` between things like `\oe` and `\OE`.

```

169 \def\bbl@cased{%
170   \ifx\oe\OE
171     \expandafter\in@\expandafter
172       {\expandafter\OE\expandafter}\expandafter{\oe}%
173   \ifin@
174     \bbl@afterelse\expandafter\MakeUppercase
175   \else
176     \bbl@afterfi\expandafter\MakeLowercase
177   \fi
178 \else
179   \expandafter\@firstofone
180 \fi}

```

The following adds some code to `\extras...` both before and after, while avoiding doing it twice. It's somewhat convoluted, to deal with `#`'s. Used to deal with `alph`, `Alph` and frenchspacing when there are already changes (with `\babel@save`).

```

181 \def\bbl@extras@wrap#1#2#3{% 1:in-test, 2:before, 3:after
182   \toks@\expandafter\expandafter\expandafter{%
183     \csname extras\language\endcsname}%
184   \bbl@exp{\in@{#1}{\the\toks@}}%
185   \ifin@\else
186     \@temptokena{#2}%
187     \edef\bbl@tempc{\the\@temptokena\the\toks@}%
188     \toks@\expandafter{\bbl@tempc#3}%
189     \expandafter\edef\csname extras\language\endcsname{\the\toks@}%
190   \fi}
191 <</Basic macros>>

```

Some files identify themselves with a  $\TeX$  macro. The following code is placed before them to define (and then undefine) if not in  $\TeX$ .

```

192 <<*Make sure ProvidesFile is defined>> ≡
193 \ifx\ProvidesFile\@undefined
194   \def\ProvidesFile#1[#2 #3 #4]{%
195     \wlog{File: #1 #4 #3 <#2>}%
196     \let\ProvidesFile\@undefined}
197 \fi
198 <</Make sure ProvidesFile is defined>>

```

### 3.1. A few core definitions

**Language** Just for compatibility, for not to touch `hyphen.cfg`.

```

199 <<*Define core switching macros>> ≡
200 \ifx\language\@undefined
201   \csname newcount\endcsname\language
202 \fi
203 <</Define core switching macros>>

```

**\last@language** Another counter is used to keep track of the allocated languages.  $\TeX$  and  $\LaTeX$  reserves for this purpose the count 19.

**\addlanguage** This macro was introduced for  $\TeX < 2$ . Preserved for compatibility.

```
204 <<*Define core switching macros>> ≡
205 \countdef\last@language=19
206 \def\addlanguage{\csname newlanguage\endcsname}
207 <</Define core switching macros>>
```

Now we make sure all required files are loaded. When the command `\AtBeginDocument` doesn't exist we assume that we are dealing with a plain-based format. In that case the file `plain.def` is needed (which also defines `\AtBeginDocument`, and therefore it is not loaded twice). We need the first part when the format is created, and `\orig@dump` is used as a flag. Otherwise, we need to use the second part, so `\orig@dump` is not defined (`plain.def` undefines it).

Check if the current version of `switch.def` has been previously loaded (mainly, `hyphen.cfg`). If not, load it now. We cannot load `babel.def` here because we first need to declare and process the package options.

### 3.2. $\LaTeX$ : `babel.sty` (start)

Here starts the style file for  $\LaTeX$ . It also takes care of a number of compatibility issues with other packages.

```
208 <*package>
209 \NeedsTeXFormat{LaTeX2e}
210 \ProvidesPackage{babel}%
211 [ <@date@> v<@version@> %%NB%%
212 The multilingual framework for pdfLaTeX, LuaLaTeX and XeLaTeX]
```

Start with some “private” debugging tools, and then define macros for errors. The global lua ‘space’ Babel is declared here, too (inside the test for debug).

```
213 \@ifpackagewith{babel}{debug}
214 {\providecommand\bbl@trace[1]{\message{^^J[ #1 ]}}%
215 \let\bbl@debug@firstofone
216 \ifx\directlua\undefined\else
217 \directlua{
218 Babel = Babel or {}
219 Babel.debug = true }%
220 \input{babel-debug.tex}%
221 \fi}

274 \fi}%
275 \bbl@languages
276 \fi%

```

### 3.3. base

The first 'real' option to be processed is base, which set the hyphenation patterns then resets ver@babel.sty so that L<sup>A</sup>T<sub>E</sub>X forgets about the first loading. After a subset of babel.def has been loaded (the old switch.def) and \AfterBabelLanguage defined, it exits.

Now the base option. With it we can define (and load, with luatex) hyphenation patterns, even if we are not interested in the rest of babel.

```

277 \bbl@trace{Defining option 'base'}
278 \@ifpackagewith{babel}{base}{%
279 \let\bbl@onlyswitch@empty

296 \endinput}{}}%

```

### 3.4. key=value options and other general option

The following macros extract language modifiers, and only real package options are kept in the option list. Modifiers are saved and assigned to `\BabelModifiers` at `\bbl@load@language`; when no modifiers have been given, the former is `\relax`.

```

297 \bbl@trace{key=value and another general options}
298 \bbl@csarg\let\tempa\expandafter\csname opt@babel.sty\endcsname
299 \def\bbl@tempb#1.#2{% Remove trailing dot
300   #1\ifx\@empty#2\else,\bbl@afterfi\bbl@tempb#2\fi}%
301 \def\bbl@tempe#1=#2\@@{%
302   \bbl@csarg\edef{mod@#1}{\bbl@tempb#2}}
303 \def\bbl@tempd#1.#2\@nnil{%^A TODO. Refactor lists?
304   \ifx\@empty#2%
305     \edef\bbl@tempc{\ifx\bbl@tempc\@empty\else\bbl@tempc,\fi#1}%
306   \else
307     \in@{,provide=}{, #1}%
308     \ifin@
309       \edef\bbl@tempc{%

316         \in@{=}{#1}%
317         \ifin@
318           \edef\bbl@tempc{\ifx\bbl@tempc\@empty\else\bbl@tempc,\fi#1.#2}%
319         \else
320           \edef\bbl@tempc{\ifx\bbl@tempc\@empty\else\bbl@tempc,\fi#1}%
321           \bbl@csarg\edef{mod@#1}{\bbl@tempb#2}%
322         \fi
323       \fi
324     \fi
325   \fi}
326 \let\bbl@tempc\@empty
327 \bbl@foreach\bbl@tempa{\bbl@tempd#1.\@empty\@nnil}
328 \expandafter\let\csname opt@babel.sty\endcsname\bbl@tempc

```

The next option tells babel to leave shorthand characters active at the end of processing the package. This is *not* the default as it can cause problems with other packages, but for those who want to use the shorthand characters in the preamble of their documents this can help.

```

329 \DeclareOption{KeepShorthandsActive}{}
330 \DeclareOption{activeacute}{}
331 \DeclareOption{activegrave}{}
332 \DeclareOption{debug}{}
333 \DeclareOption{noconfigs}{}
334 \DeclareOption{showlanguages}{}
335 \DeclareOption{silent}{}
336 \DeclareOption{shorthands=off}{\bbl@tempa shorthands=\bbl@tempa}
337 \chardef\bbl@iniflag\z@
338 \DeclareOption{provide=*}{\chardef\bbl@iniflag\@ne} % main = 1
339 \DeclareOption{provide+=*}{\chardef\bbl@iniflag\tw@} % second = 2
340 \DeclareOption{provide*=*}{\chardef\bbl@iniflag\thr@@} % second + main
341 % Don't use. Experimental. TODO.
342 \newif\ifbbl@single
343 \DeclareOption{selectors=off}{\bbl@singletrue}
344 <@More package options@>

```

Handling of package options is done in three passes. (I [JBL] am not very happy with the idea, anyway.) The first one processes options which has been declared above or follow the syntax  $\langle key \rangle = \langle value \rangle$ , the second one loads the requested languages, except the main one if set with the key main, and the third one loads the latter. First, we “flag” valid keys with a nil value.

```
345 \let\bbl@opt@shorthands\@nnil
346 \let\bbl@opt@config\@nnil
347 \let\bbl@opt@main\@nnil
348 \let\bbl@opt@headfoot\@nnil
349 \let\bbl@opt@layout\@nnil
350 \let\bbl@opt@provide\@nnil
```

The following tool is defined temporarily to store the values of options.

```
351 \def\bbl@tempa#1=#2\bbl@tempa{%
352   \bbl@csarg\ifx{opt@#1}\@nnil
353   \bbl@csarg\edef{opt@#1}{#2}%
354   \else
355   \bbl@error{bad-package-option}{#1}{#2}{}%
356   \fi}
```

Now the option list is processed, taking into account only currently declared options (including those declared with a =), and  $\langle key \rangle = \langle value \rangle$  options (the former take precedence). Unrecognized options are saved in  $\bbl@language@opts$ , because they are language options.

```
357 \let\bbl@language@opts\@empty
358 \DeclareOption*{%
359   \bbl@xin@{\string=}{\CurrentOption}%
360   \ifin@
361   \expandafter\bbl@tempa\CurrentOption\bbl@tempa
362   \else
363   \bbl@add@list\bbl@language@opts{\CurrentOption}%
364   \fi}
```

Now we finish the first pass (and start over).

```
365 \ProcessOptions*
```

### 3.5. Post-process some options

```
366 \ifx\bbl@opt@provide\@nnil
367   \let\bbl@opt@provide\@empty % %%% MOVE above
368 \else
369   \chardef\bbl@iniflag\@ne
370   \bbl@exp{\bbl@forkv{\@nameuse{@raw@opt@babel.sty}}}{%
371     \in@{,provide,}{, #1,}%
372     \ifin@
373     \def\bbl@opt@provide{#2}%
374     \fi}
375 \fi
```

If there is no shorthands= $\langle chars \rangle$ , the original babel macros are left untouched, but if there is, these macros are wrapped (in babel.def) to define only those given.

A bit of optimization: if there is no shorthands=, then  $\bbl@ifshorthand$  is always true, and it is always false if shorthands is empty. Also, some code makes sense only with shorthands=...

```
376 \bbl@trace{Conditional loading of shorthands}
377 \def\bbl@sh@string#1{%
378   \ifx#1\@empty\else
379   \ifx#1t\string~%
380   \else\ifx#1c\string,%
381   \else\string#1%
382   \fi\fi
383   \expandafter\bbl@sh@string
384   \fi}
385 \ifx\bbl@opt@shorthands\@nnil
386   \def\bbl@ifshorthand#1#2#3{#2}%
387 \else\ifx\bbl@opt@shorthands\@empty
388   \def\bbl@ifshorthand#1#2#3{#3}%
389 \fi}
```

```
389 \else
```

The following macro tests if a shorthand is one of the allowed ones.

```
390 \def\bbl@ifshorthand#1{%
391   \bbl@xin@{\string#1}{\bbl@opt@shorthands}%
392   \ifin@
393     \expandafter\@firstoftwo
394   \else
395     \expandafter\@secondoftwo
396   \fi}
```

We make sure all chars in the string are ‘other’, with the help of an auxiliary macro defined above (which also zaps spaces).

```
397 \edef\bbl@opt@shorthands{%
398   \expandafter\bbl@sh@string\bbl@opt@shorthands\@empty}%
```

The following is ignored with shorthands=off, since it is intended to take some additional actions for certain chars.

```
399 \bbl@ifshorthand{'}%
400   {\PassOptionsToPackage{activeacute}{babel}}{}
401 \bbl@ifshorthand{'}%
402   {\PassOptionsToPackage{activegrave}{babel}}{}
403 \fi\fi
```

With headfoot=lang we can set the language used in heads/feet. For example, in babel/3796 just add headfoot=english. It misuses \resetactivechars, but seems to work.

```
404 \ifx\bbl@opt@headfoot\@nnil\else
405   \g@addto@macro\@resetactivechars{%
406     \set@typeset@protect
407     \expandafter\select@language@x\expandafter{\bbl@opt@headfoot}%
408     \let\protect\noexpand}
409 \fi
```

For the option safe we use a different approach – \bbl@opt@safe says which macros are redefined (B for bibs and R for refs). By default, both are currently set, but in a future release it will be set to none.

```
410 \ifx\bbl@opt@safe\@undefined
411   \def\bbl@opt@safe{BR}
412   % \let\bbl@opt@safe\@empty % Pending of \cite
413 \fi
```

For layout an auxiliary macro is provided, available for packages and language styles.

Optimization: if there is no layout, just do nothing.

```
414 \bbl@trace{Defining IfBabelLayout}
415 \ifx\bbl@opt@layout\@nnil
416   \newcommand\IfBabelLayout[3]{#3}%
417 \else
418   \bbl@exp{\bbl@forkv{\@nameuse{\raw@opt@babel.sty}}}{%
419     \in@{, layout,}{, #1,}%
420     \ifin@
421       \def\bbl@opt@layout{#2}%
422       \bbl@replace\bbl@opt@layout{ }{.}%
423     \fi}
424   \newcommand\IfBabelLayout[1]{%
425     \@expandtwoargs\in@{.#1.}{.\bbl@opt@layout.}%
426     \ifin@
427       \expandafter\@firstoftwo
428     \else
429       \expandafter\@secondoftwo
430     \fi}
431 \fi
432 \</package>
```

### 3.6. Plain: babel.def (start)

Because of the way docstrip works, we need to insert some code for Plain here. However, the tools provided by the babel installer for literate programming makes this section a short interlude, because the actual code is below, tagged as *Emulate LaTeX*.

First, exit immediately if previously loaded.

```
433 < *core >
434 \ifx\ldf@quit\@undefined\else
435 \endinput\fi % Same line!
436 <@Make sure ProvidesFile is defined@>
437 \ProvidesFile{babel.def}[<@date@> v<@version@> Babel common definitions]
438 \ifx\AtBeginDocument\@undefined %^^A TODO. change test.
439 <@Emulate LaTeX@>
440 \fi
441 <@Basic macros@>
442 < /core >
```

That is all for the moment. Now follows some common stuff, for both Plain and  $\text{\LaTeX}$ . After it, we will resume the  $\text{\LaTeX}$ -only stuff.

## 4. babel.sty and babel.def (common)

```
443 < *package | core >
444 \def\bbl@version{<@version@>}
445 \def\bbl@date{<@date@>}
446 <@Define core switching macros@>
```

**\adddialect** The macro `\adddialect` can be used to add the name of a dialect or variant language, for which an already defined hyphenation table can be used.

```
447 \def\adddialect#1#2{%
448   \global\chardef#1#2\relax
449   \bbl@usehooks{adddialect}{#{1}{#2}}%
450   \begingroup
451     \count@#1\relax
452     \def\bbl@elt##1##2###3###4{%
453       \ifnum\count@=##2\relax
454         \edef\bbl@tempa{\expandafter\@gobbletwo\string#1}%
455         \bbl@info{Hyphen rules for '\expandafter\@gobble\bbl@tempa'
456               set to \expandafter\string\csname l@##1\endcsname\\%
457               (\string\language\the\count@). Reported}%
458         \def\bbl@elt####1####2####3####4{%
459           \fi}%
460       \bbl@cs{languages}%
461       \endgroup}
```

`\bbl@iflanguage` executes code only if the language `l@` exists. Otherwise raises an error.

The argument of `\bbl@fixname` has to be a macro name, as it may get “fixed” if casing (lc/uc) is wrong. It’s an attempt to fix a long-standing bug when `\foreignlanguage` and the like appear in a `\MakeXXXcase`. However, a lowercase form is not imposed to improve backward compatibility (perhaps you defined a language named MYLANG, but unfortunately mixed case names cannot be trapped). Note `l@` is encapsulated, so that its case does not change.

```
462 \def\bbl@fixname#1{%
463   \begingroup
464     \def\bbl@tempe{l@}%
465     \edef\bbl@tempd{\noexpand\@ifundefined{\noexpand\bbl@tempe#1}}%
466     \bbl@tempd

471          {\uppercase\expandafter{\bbl@tempd}}}%
472         {\edef\bbl@tempd{\def\noexpand#1{#1}}%
473          {\lowercase\expandafter{\bbl@tempd}}}%
474         \@empty
475         \edef\bbl@tempd{\endgroup\def\noexpand#1{#1}}%
476     \bbl@tempd
477     \bbl@exp{\bbl@usehooks{language}{\language}{#1}}
478 \def\bbl@iflanguage#1{%
```

```
479 \ifundefined{#1}{\@nolanerr{#1}\@gobble}\@firstofone}
```

After a name has been ‘fixed’, the selectors will try to load the language. If even the fixed name is not defined, will load it on the fly, either based on its name, or if activated, its BCP 47 code.

We first need a couple of macros for a simple BCP 47 look up. It also makes sure, with `\bbl@bcpcase`, casing is the correct one, so that `sr-latn-ba` becomes `fr-Latn-BA`. Note #4 may contain some `\@empty`’s, but they are eventually removed. `\bbl@bcpllookup` either returns the found `ini` or it is `\relax`.

```
480 \def\bbl@bcpcase#1#2#3#4\@#5{%
481   \ifx\@empty#3%
482     \uppercase{\def#5{#1#2}}%

516     \ifx\bbl@bcp\relax
517       \IfFileExists{babel-\bbl@tempa.ini}{\let\bbl@bcp\bbl@tempa}{}%
518     \fi
519   \fi\fi}
520 \let\bbl@initoload\relax
```

**\iflanguage** Users might want to test (in a private package for instance) which language is currently active. For this we provide a test macro, `\iflanguage`, that has three arguments. It checks whether the first argument is a known language. If so, it compares the first argument with the value of `\language`. Then, depending on the result of the comparison, it executes either the second or the third argument.

```
521 \def\iflanguage#1{%
522   \bbl@iflanguage{#1}{%
523     \ifnum\csname l@#1\endcsname=\language
524       \expandafter\@firstoftwo
525     \else
526       \expandafter\@secondoftwo
527     \fi}}
```

## 4.1. Selecting the language

**\selectlanguage** It checks whether the language is already defined before it performs its actual task, which is to update \language and activate language-specific definitions.

```
528 \let\bbl@select@type\z@
529 \edef\selectlanguage{%
530   \noexpand\protect
531   \expandafter\noexpand\csname selectlanguage \endcsname}
```

Because the command \selectlanguage could be used in a moving argument it expands to \protect\selectlanguage\_. Therefore, we have to make sure that a macro \protect exists. If it doesn't it is \let to \relax.

```
532 \ifx\@undefined\protect\let\protect\relax\fi
```

The following definition is preserved for backwards compatibility (e.g., arabi, koma). It is related to a trick for 2.09, now discarded.

```
533 \let\xstring\string
```

Since version 3.5 babel writes entries to the auxiliary files in order to typeset table of contents etc. in the correct language environment.

**\bbl@pop@language** But when the language change happens *inside* a group the end of the group doesn't write anything to the auxiliary files. Therefore we need TeX's aftergroup mechanism to help us. The command \aftergroup stores the token immediately following it to be executed when the current group is closed. So we define a temporary control sequence \bbl@pop@language to be executed at the end of the group. It calls \bbl@set@language with the name of the current language as its argument.

**\bbl@language@stack** The previous solution works for one level of nesting groups, but as soon as more levels are used it is no longer adequate. For that case we need to keep track of the nested languages using a stack mechanism. This stack is called \bbl@language@stack and initially empty.

```
534 \def\bbl@language@stack{}
```

When using a stack we need a mechanism to push an element on the stack and to retrieve the information afterwards.

**\bbl@push@language**

**\bbl@pop@language** The stack is simply a list of languagenames, separated with a '+' sign; the push function can be simple:

```
535 \def\bbl@push@language{%
536   \ifx\language\@undefined\else
537     \ifx\currentgrouplevel\@undefined
538       \xdef\bbl@language@stack{\language+\bbl@language@stack}%
539     \else
540       \ifnum\currentgrouplevel=\z@
541         \xdef\bbl@language@stack{\language+}%
542       \else
543         \xdef\bbl@language@stack{\language+\bbl@language@stack}%
544       \fi
545     \fi
546   \fi}
```

Retrieving information from the stack is a little bit less simple, as we need to remove the element from the stack while storing it in the macro \language. For this we first define a helper function.

**\bbl@pop@lang** This macro stores its first element (which is delimited by the '+'-sign) in \language and stores the rest of the string in \bbl@language@stack.

```
547 \def\bbl@pop@lang#1+#2\@{%
548   \edef\language{#1}%
549   \xdef\bbl@language@stack{#2}}
```

The reason for the somewhat weird arrangement of arguments to the helper function is the fact it is called in the following way. This means that before `\bbl@pop@lang` is executed TeX first *expands* the stack, stored in `\bbl@language@stack`. The result of that is that the argument string of `\bbl@pop@lang` contains one or more language names, each followed by a ‘+’-sign (zero language names won’t occur as this macro will only be called after something has been pushed on the stack).

```
550 \let\bbl@ifrestoring\@secondoftwo
551 \def\bbl@pop@language{%
552   \expandafter\bbl@pop@lang\bbl@language@stack\@@
553   \let\bbl@ifrestoring\@firstoftwo
554   \expandafter\bbl@set@language\expandafter{\language}%
555   \let\bbl@ifrestoring\@secondoftwo}
```

Once the name of the previous language is retrieved from the stack, it is fed to `\bbl@set@language` to do the actual work of switching everything that needs switching.

An alternative way to identify languages (in the babel sense) with a numerical value is introduced in 3.30. This is one of the first steps for a new interface based on the concept of locale, which explains the name of `\localeid`. This means `\l@...` will be reserved for hyphenation patterns (so that two locales can share the same rules).

```
556 \chardef\localeid\z@
557 \def\bbl@id@last{0} % No real need for a new counter
558 \def\bbl@id@assign{%
559   \bbl@ifunset\bbl@id@\language}%

565      \directlua{
566        Babel.locale_props[\bbl@id@last] = {}
567        Babel.locale_props[\bbl@id@last].name = '\language'
568        Babel.locale_props[\bbl@id@last].vars = {}
569      }%
570    \fi}%
571  }%
572  \chardef\localeid\bbl@c{id@}
```

The unprotected part of `\selectlanguage`. In case it is used as environment, declare `\endselectlanguage`, just for safety.

```
573 \expandafter\def\csname selectlanguage \endcsname#1{%
574   \ifnum\bbl@hymapsel=\ccclv\let\bbl@hymapsel\tw@\fi
575   \bbl@push@language
576   \aftergroup\bbl@pop@language
577   \bbl@set@language{#1}}
578 \let\endselectlanguage\relax
```

**`\bbl@set@language`** The macro `\bbl@set@language` takes care of switching the language environment *and* of writing entries on the auxiliary files. For historical reasons, language names can be either `language` or `\language`. To catch either form a trick is used, but unfortunately as a side effect the catcodes of letters in `\language` are messed up. This is a bug, but preserved for backwards compatibility. The list of auxiliary files can be extended by redefining `\BabelContentsFiles`, but make sure they are loaded inside a group (as `aux`, `toc`, `lof`, and `lot` do) or the last language of the document will remain active afterwards.

We also write a command to change the current language in the auxiliary files.

`\bbl@save@lastskip` is used to deal with skips before the write whatsit (as suggested by U Fischer). Adapted from `hyperref`, but it might fail, so I’ll consider it a temporary hack, while I study other options (the ideal, but very likely unfeasible except perhaps in `luatex`, is to avoid the `\write` altogether when not needed).

```

```

First, check if the user asks for a known language. If so, update the value of `\language` and call `\originalTeX` to bring  $\TeX$  in a certain pre-defined state.

The name of the language is stored in the control sequence `\language`.

Then we have to *redefine* `\originalTeX` to compensate for the things that have been activated. To save memory space for the macro definition of `\originalTeX`, we construct the control sequence name for the `\noextras<language>` command at definition time by expanding the `\csname` primitive.

Now activate the language-specific definitions. This is done by constructing the names of three macros by concatenating three words with the argument of `\selectlanguage`, and calling these macros.

The switching of the values of `\lefthyphenmin` and `\righthyphenmin` is somewhat different. First we save their current values, then we check if `\<language>hyphenmins` is defined. If it is not, we set default values (2 and 3), otherwise the values in `\<language>hyphenmins` will be used.

No text is supposed to be added with switching captions and date, so we remove any spurious spaces with `\bbl@bsphack` and `\bbl@esphack`.

At the end of the environment we need to switch off the extra definitions. The grouping mechanism of the environment will take care of resetting the correct hyphenation rules and “extras”.

```

734 \expandafter\let\csname endotherlanguage*\endcsname\relax

```

**\foreignlanguage** This command takes two arguments, the first argument is the name of the language to use for typesetting the text specified in the second argument.

Unlike `\selectlanguage` this command doesn’t switch *everything*, it only switches the hyphenation rules and the extra definitions for the language specified. It does this within a group and assumes the `\extras<language>` command doesn’t make any `\global` changes. The coding is very similar to part of `\selectlanguage`.

`\bbl@beforeforeign` is a trick to fix a bug in bidi texts. `\foreignlanguage` is supposed to be a ‘text’ command, and therefore it must emit a `\leavevmode`, but it does not, and therefore the indent is placed on the opposite margin. For backward compatibility, however, it is done only if a right-to-left script is requested; otherwise, it is no-op.

(3.11) `\foreignlanguage*` is a temporary, experimental macro for a few lines with a different script direction, while preserving the paragraph format (thank the braces around `\par`, things like `\hangindent` are not reset). Do not use it in production, because its semantics and its syntax may change (and very likely will, or even it could be removed altogether). Currently it enters in vmode and then selects the language (which in turn sets the paragraph direction).

(3.11) Also experimental are the hook `foreign` and `foreign*`. With them you can redefine `\BabelText` which by default does nothing. Its behavior is not well defined yet. So, use it in horizontal mode only if you do not want surprises.

In other words, at the beginning of a paragraph `\foreignlanguage` enters into hmode with the surrounding lang, and with `\foreignlanguage*` with the new lang.

```

```

**\providehyphenmins** The macro `\providehyphenmins` should be used in the language definition files to provide a *default* setting for the hyphenation parameters `\lefthyphenmin` and `\righthyphenmin`. If the macro `\(language)hyphenmins` is already defined this command has no effect.

```

830 \def\providehyphenmins#1#2{%
831 \expandafter\ifx\csname #1hyphenmins\endcsname\relax
832 \@namedef{#1hyphenmins}{#2}%
833 \fi}

```

**\set@hyphenmins** This macro sets the values of `\lefthyphenmin` and `\righthyphenmin`. It expects two values as its argument.

```

834 \def\set@hyphenmins#1#2{%
835 \lefthyphenmin#1\relax
836 \righthyphenmin#2\relax}

```

**\ProvidesLanguage** The identification code for each file is something that was introduced in  $\text{\LaTeX 2}_{\epsilon}$ . When the command `\ProvidesFile` does not exist, a dummy definition is provided temporarily. For use in the language definition file the command `\ProvidesLanguage` is defined by `babel`.

Depending on the format, i.e., or if the former is defined, we use a similar definition or not.

```

837 \ifx\ProvidesFile\@undefined
838 \def\ProvidesLanguage#1[#2 #3 #4]{%
839 \wlog{Language: #1 #4 #3 <#2>}%
840 }
841 \else
842 \def\ProvidesLanguage#1{%
843 \begingroup
844 \catcode`\ 10 %
845 \@makeother\/%
846 \@ifnextchar[%]
847 {\@provideslanguage{#1}}{\@provideslanguage{#1}[]}}
848 \def\@provideslanguage#1[#2]{%
849 \wlog{Language: #1 #2}%
850 \expandafter\xdef\csname ver@#1.ldf\endcsname{#2}%
851 \endgroup}
852 \fi

```

**\originalTeX** The macro `\originalTeX` should be known to  $\text{\TeX}$  at this moment. As it has to be expandable we `\let` it to `\@empty` instead of `\relax`.

```

853 \ifx\originalTeX\@undefined\let\originalTeX\@empty\fi

```

Because this part of the code can be included in a format, we make sure that the macro which initializes the save mechanism, `\babel@beginsave`, is not considered to be undefined.

```

854 \ifx\babel@beginsave\@undefined\let\babel@beginsave\relax\fi

```

A few macro names are reserved for future releases of `babel`, which will use the concept of ‘locale’:

```

855 \providecommand\setlocale{\bbl@error{not-yet-available}}{}{}
856 \let\uselocale\setlocale
857 \let\locale\setlocale
858 \let\selectlocale\setlocale
859 \let\textlocale\setlocale
860 \let\textlanguage\setlocale
861 \let\languagegetext\setlocale

```

## 4.2. Errors

**\@nolanerr**

**\@nopatterns** The babel package will signal an error when a documents tries to select a language that hasn't been defined earlier. When a user selects a language for which no hyphenation patterns were loaded into the format he will be given a warning about that fact. We revert to the patterns for \language=0 in that case. In most formats that will be (US)english, but it might also be empty.

**\@noopterr** When the package was loaded without options not everything will work as expected. An error message is issued in that case.

When the format knows about \PackageError it must be  $\text{\LaTeX 2}_{\epsilon}$ , so we can safely use its error handling interface. Otherwise we'll have to 'keep it simple'.

Infos are not written to the console, but on the other hand many people think warnings are errors, so a further message type is defined: an important info which is sent to the console.

### 4.3. More on selection

**\babelensure** The user command just parses the optional argument and creates a new macro named \bbl@e@<language>. We register a hook at the afterextras event which just executes this macro in a “complete” selection (which, if undefined, is \relax and does nothing). This part is somewhat involved because we have to make sure things are expanded the correct number of times.

The macro \bbl@e@<language> contains \bbl@ensure{<include>}{<exclude>}{<fontenc>}, which in turn loops over the macros names in \bbl@captionslist, excluding (with the help of \in@) those in the exclude list. If the fontenc is given (and not \relax), the \fontencoding is also added. Then we loop over the include list, but if the macro already contains \foreignlanguage, nothing is done. Note this macro (1) is not restricted to the preamble, and (2) changes are local.

```

893 \bbl@trace{Defining babelensure}
894 \newcommand\babelensure[2][]{%
895   \AddBabelHook{babel-ensure}{afterextras}{%
896     \ifcase\bbl@select@type
897       \bbl@cl{e}%

```

```

898 \fi}%

```

## 4.4. Short tags

**\babeltags** This macro is straightforward. After zapping spaces, we loop over the list and define the macros `\text⟨tag⟩` and `\⟨tag⟩`. Definitions are first expanded so that they don't contain `\csname` but the actual macro.

```
957 \bbl@trace{Short tags}
958 \newcommand\babeltags[1]{%
959   \edef\bbl@tempa{\zap@space#1 \@empty}%
960   \def\bbl@tempb##1=##2\@{ %

966       \noexpand\newcommand
967       \expandafter\noexpand\csname text##1\endcsname{%
968         \noexpand\foreignlanguage{##2}}
969     \bbl@tempc}%
970   \bbl@for\bbl@tempa\bbl@tempa{%
971     \expandafter\bbl@tempb\bbl@tempa\@{}}
```

## 4.5. Compatibility with language.def

Plain e-TeX doesn't rely on language.dat, but babel can be made compatible with this format easily.

```
972 \bbl@trace{Compatibility with language.def}
973 \ifx\directlua\@undefined\else
974   \ifx\bbl@luapatterns\@undefined
975     \input luabelabel.def
976   \fi
977 \fi
978 \ifx\bbl@languages\@undefined
979   \ifx\directlua\@undefined
980     \openin1 = language.def % TODO. Remove hardcoded number
981     \ifeof1
982       \closein1
983       \message{I couldn't find the file language.def}
984     \else
985       \closein1
986       \begingroup
987         \def\addlanguage#1#2#3#4#5{%
988           \expandafter\ifx\csname lang@#1\endcsname\relax\else
989             \global\expandafter\let\csname l@#1\endcsname
990               \csname lang@#1\endcsname
991           \fi}%
992         \def\uselanguage#1{%
993           \input language.def
994         \endgroup
995       \fi
996     \fi
997   \chardef\l@english\z@
998 \fi
```

**\addto** It takes two arguments, a *⟨control sequence⟩* and TeX-code to be added to the *⟨control sequence⟩*.

If the *⟨control sequence⟩* has not been defined before it is defined now. The control sequence could also expand to `\relax`, in which case a circular definition results. The net result is a stack overflow. Note there is an inconsistency, because the assignment in the last branch is global.

```
999 \def\addto#1#2{%
1000   \ifx#1\@undefined
1001     \def#1{#2}%
1002   \else
1003     \ifx#1\relax
```

```

1004     \def#1{#2}%

1007     \xdef#1{\the\toks@}}%
1008     \fi
1009 \fi}

```

## 4.6. Hooks

Admittedly, the current implementation is a somewhat simplistic and does very little to catch errors, but it is meant for developers, after all. `\bbl@usehooks` is the commands used by babel to execute hooks defined for an event.

```

1010 \bbl@trace{Hooks}
1011 \newcommand\AddBabelHook[3][ ]{%
1012   \bbl@i funset{\bbl@hk@#2}{\EnableBabelHook{#2}}}%
1013   \def\bbl@tempa##1,##3=##2,##3\@empty{\def\bbl@tempb{##2}}%
1014   \expandafter\bbl@tempa\bbl@evargs,##3=,\@empty
1015   \bbl@i funset{\bbl@ev@#2@#3@#1}%
1016   {\bbl@csarg\bbl@add{ev@#3@#1}{\bbl@elth{#2}}}%
1017   {\bbl@csarg\let{ev@#2@#3@#1}\relax}%
1018   \bbl@csarg\newcommand{ev@#2@#3@#1}{\bbl@tempb}}
1019 \newcommand\EnableBabelHook[1]{\bbl@csarg\let{hk@#1}\@firstofone}
1020 \newcommand\DisableBabelHook[1]{\bbl@csarg\let{hk@#1}\@gobble}
1021 \def\bbl@usehooks{\bbl@usehooks@lang\language}
1022 \def\bbl@usehooks@lang#1#2#3{% Test for Plain
1023   \ifx\UseHook\@undefined\else\UseHook{babel/#1/#2}\fi
1024   \def\bbl@elth##1{%
1025     \bbl@cs{hk@##1}{\bbl@cs{ev@##1@#2@#3}}%
1026     \bbl@cs{ev@#2@#3}%
1027     \ifx\language\@undefined\else % Test required for Plain (?)
1028       \ifx\UseHook\@undefined\else\UseHook{babel/#1/#2}\fi
1029       \def\bbl@elth##1{%
1030         \bbl@cs{hk@##1}{\bbl@cs{ev@##1@#2@#3}}%
1031         \bbl@cs{ev@#2@#3}%
1032       \fi}

```

To ensure forward compatibility, arguments in hooks are set implicitly. So, if a further argument is added in the future, there is no need to change the existing code. Note events intended for `hyphen.cfg` are also loaded (just in case you need them for some reason).

```

1033 \def\bbl@evargs{,% <- don't delete this comma

1041   \bbl@foreach\bbl@evargs{\bbl@tempa#1\@@}
1042 \fi

```

Since the following command is meant for a hook (although a  $\TeX$  one), it's placed here.

```

1043 \providecommand\PassOptionsToLocale[2]{%
1044   \bbl@csarg\bbl@add@list{passto@#2}{#1}}

```

## 4.7. Setting up language files

**\LdfInit** `\LdfInit` macro takes two arguments. The first argument is the name of the language that will be defined in the language definition file; the second argument is either a control sequence or a string from which a control sequence should be constructed. The existence of the control sequence indicates that the file has been processed before.

At the start of processing a language definition file we always check the category code of the at-sign. We make sure that it is a 'letter' during the processing of the file. We also save its name as the last called option, even if not loaded.

Another character that needs to have the correct category code during processing of language definition files is the equals sign, ‘=’, because it is sometimes used in constructions with the `\let` primitive. Therefore we store its current catcode and restore it later on.

Now we check whether we should perhaps stop the processing of this file. To do this we first need to check whether the second argument that is passed to `\LdfInit` is a control sequence. We do that by looking at the first token after passing #2 through `string`. When it is equal to `\@backslashchar` we are dealing with a control sequence which we can compare with `\@undefined`.

If so, we call `\ldf@quit` to set the main language, restore the category code of the `@`-sign and call `\endinput`

When #2 was *not* a control sequence we construct one and compare it with `\relax`.

Finally we check `\originalTeX`.

```

1045 \bbl@trace{Macros for setting language files up}
1046 \def\bbl@ldfinit{%
1047   \let\bbl@screset\@empty

1056 \def\LdfInit#1#2{%
1057   \chardef\atcatcode=\catcode`\@
1058   \catcode`\@=11\relax
1059   \chardef\eqcatcode=\catcode`\=
1060   \catcode`\==12\relax
1061   \expandafter\if\expandafter\@backslashchar
1062     \expandafter\@car\string#2\@nil
1063   \ifx#2\@undefined\else
1064     \ldf@quit{#1}%
1065   \fi
1066 \else
1067   \expandafter\ifx\csname#2\endcsname\relax\else
1068     \ldf@quit{#1}%
1069   \fi
1070 \fi
1071 \bbl@ldfinit}

```

**\ldf@quit** This macro interrupts the processing of a language definition file.

```

1072 \def\ldf@quit#1{%
1073   \expandafter\main@language\expandafter{#1}%
1074   \catcode`\@=\atcatcode \let\atcatcode\relax
1075   \catcode`\==\eqcatcode \let\eqcatcode\relax
1076   \endinput}

```

**\ldf@finish** This macro takes one argument. It is the name of the language that was defined in the language definition file.

We load the local configuration file if one is present, we set the main language (taking into account that the argument might be a control sequence that needs to be expanded) and reset the category code of the `@`-sign.

```

1077 \def\bbl@afterldf#1{%^A TODO. #1 is not used. Remove
1078   \bbl@afterlang
1079   \let\bbl@afterlang\relax
1080   \let\BabelModifiers\relax
1081   \let\bbl@screset\relax}%
1082 \def\ldf@finish#1{%

1086   \catcode`\@=\atcatcode \let\atcatcode\relax
1087   \catcode`\==\eqcatcode \let\eqcatcode\relax}

```

After the preamble of the document the commands `\LdfInit`, `\ldf@quit` and `\ldf@finish` are no longer needed. Therefore they are turned into warning messages in  $\TeX$ .

```
1088 \@onlypreamble\LdfInit
1089 \@onlypreamble\ldf@quit
1090 \@onlypreamble\ldf@finish
```

### **\main@language**

**\bbl@main@language** This command should be used in the various language definition files. It stores its argument in `\bbl@main@language`; to be used to switch to the correct language at the beginning of the document.

```
1091 \def\main@language#1{%
1092   \def\bbl@main@language{#1}%
1093   \let\language\main@language
1094   \let\localename\bbl@main@language
1095   \let\mainlocalename\bbl@main@language
1096   \bbl@id@assign
1097   \bbl@patterns{\language}}
```

We also have to make sure that some code gets executed at the beginning of the document, either when the aux file is read or, if it does not exist, when the `\AtBeginDocument` is executed. Languages do not set `\pagedir`, so we set here for the whole document to the main `\bodydir`.

The code written to the aux file attempts to avoid errors if babel is removed from the document.

```
1098 \def\bbl@beforestart{%
1099   \def\@nolanerr##1{%
1100     \bbl@carg\chardef{l@##1}\z@

1126     \select@language{#1}%
1127   \fi}
```

## **4.8. Shorthands**

The macro `\initiate@active@char` below takes all the necessary actions to make its argument a shorthand character. The real work is performed once for each character. But first we define a little tool.

```
1128 \bbl@trace{Shorthands}
1129 \def\bbl@withactive#1#2{%
```

```

1130 \begingroup
1131 \lccode`~=`#2\relax
1132 \lowercase{\endgroup#1~}}

```

**\bbl@add@special** The macro `\bbl@add@special` is used to add a new character (or single character control sequence) to the macro `\dospecials` (and `\@sanitize` if  $\TeX$  is used). It is used only at one place, namely when `\initiate@active@char` is called (which is ignored if the char has been made active before). Because `\@sanitize` can be undefined, we put the definition inside a conditional.

Items are added to the lists without checking its existence or the original catcode. It does not hurt, but should be fixed. It's already done with `\nfss@catcodes`, added in 3.10.

```

1133 \def\bbl@add@special#1{% 1:a macro like \", \?, etc.
1134 \bbl@add\dospecials{\do#1}% test @sanitize = \relax, for back. compat.
1135 \bbl@ifunset{@sanitize}{\bbl@add@sanitize{\@makeother#1}}%
1136 \ifx\nfss@catcodes\undefined\else % TODO - same for above
1137 \begingroup
1138 \catcode`#1\active
1139 \nfss@catcodes
1140 \ifnum\catcode`#1=\active
1141 \endgroup
1142 \bbl@add\nfss@catcodes{\@makeother#1}%
1143 \else
1144 \endgroup
1145 \fi
1146 \fi}

```

**\initiate@active@char** A language definition file can call this macro to make a character active. This macro takes one argument, the character that is to be made active. When the character was already active this macro does nothing. Otherwise, this macro defines the control sequence `\normal@char<char>` to expand to the character in its ‘normal state’ and it defines the active character to expand to `\normal@char<char>` by default (`<char>` being the character to be made active). Later its definition can be changed to expand to `\active@char<char>` by calling `\bbl@activate{<char>}`.

For example, to make the double quote character active one could have `\initiate@active@char{"}` in a language definition file. This defines `"` as `\active@prefix "\active@char"` (where the first `"` is the character with its original catcode, when the shorthand is created, and `\active@char` is a single token). In protected contexts, it expands to `\protect "` or `\noexpand "` (i.e., with the original `"`); otherwise `\active@char` is executed. This macro in turn expands to `\normal@char` in “safe” contexts (e.g., `\label`), but `\user@active` in normal “unsafe” ones. The latter search a definition in the user, language and system levels, in this order; but if none is found, `\normal@char` is used. However, a deactivated shorthand (with `\bbl@deactivate` is defined as `\active@prefix "\normal@char`).

The following macro is used to define shorthands in the three levels. It takes 4 arguments: the (string’ed) character, `\<level>@group`, `\<level>@active` and `\<next-level>@active` (except in system).

```

1147 \def\bbl@active@def#1#2#3#4{%
1148 \namedef{#3#1}{%
1149 \expandafter\ifx\csname#2@sh@#1\endcsname\relax
1150 \bbl@afterelse\bbl@sh@select#2#1{#3@arg#1}{#4#1}%
1151 \else
1152 \bbl@afterfi\csname#2@sh@#1\endcsname
1153 \fi}%

```

When there is also no current-level shorthand with an argument we will check whether there is a next-level defined shorthand for this active character.

```

1154 \long\namedef{#3@arg#1}##1{%
1155 \expandafter\ifx\csname#2@sh@#1\string##1\endcsname\relax
1156 \bbl@afterelse\csname#4#1\endcsname##1%
1157 \else
1158 \bbl@afterfi\csname#2@sh@#1\string##1\endcsname
1159 \fi}}%

```

`\initiate@active@char` calls `\@initiate@active@char` with 3 arguments. All of them are the same character with different catcodes: active, other (`\string’ed`) and the original one. This trick simplifies the code a lot.

```

1160 \def\initiate@active@char#1{%
1161   \bbl@ifunset{active@char\string#1}%
1162   {\bbl@withactive
1163     {\expandafter\@initiate@active@char\expandafter}#1\string#1}%
1164   {}}

```

The very first thing to do is saving the original catcode and the original definition, even if not active, which is possible (undefined characters require a special treatment to avoid making them \relax and preserving some degree of protection).

```

1165 \def\@initiate@active@char#1#2#3{%
1166   \bbl@csarg\edef{oricat@#2}{\catcode`#2=\the\catcode`#2\relax}%
1167   \ifx#1\@undefined
1168     \bbl@csarg\def{oridef@#2}{\def#1{\active@prefix#1\@undefined}}%
1169   \else
1170     \bbl@csarg\let{oridef@#2}#1%
1171     \bbl@csarg\edef{oridef@#2}{%
1172       \let\noexpand#1%
1173       \expandafter\noexpand\csname bbl@oridef@#2\endcsname}%
1174   \fi

```

If the character is already active we provide the default expansion under this shorthand mechanism. Otherwise we write a message in the transcript file, and define \normal@char⟨char⟩ to expand to the character in its default state. If the character is mathematically active when babel is loaded (for example ' ) the normal expansion is somewhat different to avoid an infinite loop (but it does not prevent the loop if the mathcode is set to "8000 *a posteriori*).

```

1175   \ifx#1#3\relax
1176     \expandafter\let\csname normal@char#2\endcsname#3%
1177   \else
1178     \bbl@info{Making #2 an active character}%
1179     \ifnum\mathcode`#2=\ifodd\bbl@engine"1000000 \else"8000 \fi
1180     \@namedef{normal@char#2}{%
1181       \textormath{#3}{\csname bbl@oridef@#2\endcsname}}%
1182     \else
1183       \@namedef{normal@char#2}{#3}%
1184     \fi

```

To prevent problems with the loading of other packages after babel we reset the catcode of the character to the original one at the end of the package and of each language file (except with KeepShorthandsActive). It is re-activate again at \begin{document}. We also need to make sure that the shorthands are active during the processing of the aux file. Otherwise some citations may give unexpected results in the printout when a shorthand was used in the optional argument of \bibitem for example. Then we make it active (not strictly necessary, but done for backward compatibility).

```

1185   \bbl@restoreactive{#2}%
1186   \AtBeginDocument{%
1187     \catcode`#2\active
1188     \if@filesw
1189       \immediate\write\@mainaux{\catcode`\string#2\active}%
1190     \fi}%
1191   \expandafter\bbl@add@special\csname#2\endcsname
1192   \catcode`#2\active
1193 \fi

```

Now we have set \normal@char⟨char⟩, we must define \active@char⟨char⟩, to be executed when the character is activated. We define the first level expansion of \active@char⟨char⟩ to check the status of the @safe@actives flag. If it is set to true we expand to the 'normal' version of this character, otherwise we call \user@active⟨char⟩ to start the search of a definition in the user, language and system levels (or eventually normal@char⟨char⟩).

```

1194 \let\bbl@tempa\@firstoftwo
1195 \if\string^#2%
1196   \def\bbl@tempa{\noexpand\textormath}%
1197 \else
1198   \ifx\bbl@mathnormal\@undefined\else
1199     \let\bbl@tempa\bbl@mathnormal
1200   \fi

```

```

1201 \fi
1202 \expandafter\edef\csname active@char#2\endcsname{%
1203   \bbl@tempa
1204   {\noexpand\if@safe@actives
1205     \noexpand\expandafter
1206     \expandafter\noexpand\csname normal@char#2\endcsname
1207     \noexpand\else
1208       \noexpand\expandafter
1209       \expandafter\noexpand\csname bbl@doactive#2\endcsname
1210     \noexpand\fi}%
1211   {\expandafter\noexpand\csname normal@char#2\endcsname}}%
1212 \bbl@csarg\edef{doactive#2}{%
1213   \expandafter\noexpand\csname user@active#2\endcsname}%

```

We now define the default values which the shorthand is set to when activated or deactivated. It is set to the deactivated form (globally), so that the character expands to

$$\backslash active@prefix \langle char \rangle \backslash normal@char \langle char \rangle$$

(where  $\backslash active@char \langle char \rangle$  is *one* control sequence!).

```

1214 \bbl@csarg\edef{active@#2}{%
1215   \noexpand\active@prefix\noexpand#1%
1216   \expandafter\noexpand\csname active@char#2\endcsname}%
1217 \bbl@csarg\edef{normal@#2}{%
1218   \noexpand\active@prefix\noexpand#1%
1219   \expandafter\noexpand\csname normal@char#2\endcsname}%
1220 \bbl@ncarg\let#1\bbl@normal@#2}%

```

The next level of the code checks whether a user has defined a shorthand for himself with this character. First we check for a single character shorthand. If that doesn't exist we check for a shorthand with an argument.

```

1221 \bbl@active@def#2\user@group{user@active}{language@active}%
1222 \bbl@active@def#2\language@group{language@active}{system@active}%
1223 \bbl@active@def#2\system@group{system@active}{normal@char}%

```

In order to do the right thing when a shorthand with an argument is used by itself at the end of the line we provide a definition for the case of an empty argument. For that case we let the shorthand character expand to its non-active self. Also, When a shorthand combination such as ' ' ends up in a heading  $\TeX$  would see  $\backslash protect '\backslash protect '$ . To prevent this from happening a couple of shorthand needs to be defined at user level.

```

1224 \expandafter\edef\csname\user@group @sh#2@@\endcsname
1225   {\expandafter\noexpand\csname normal@char#2\endcsname}%
1226 \expandafter\edef\csname\user@group @sh#2@\string\protect@\endcsname
1227   {\expandafter\noexpand\csname user@active#2\endcsname}%

```

Finally, a couple of special cases are taken care of. (1) If we are making the right quote (') active we need to change  $\backslash prim@s$  as well. Also, make sure that a single ' in math mode 'does the right thing'. (2) If we are using the caret (^) as a shorthand character special care should be taken to make sure math still works. Therefore an extra level of expansion is introduced with a check for math mode on the upper level.

```

1228 \if\string'#2%
1229   \let\prim@s\bbl@prim@s
1230   \let\active@math@prime#1%
1231 \fi
1232 \bbl@usehooks{initiateactive}{\#1}{\#2}{\#3}}

```

The following package options control the behavior of shorthands in math mode.

```

1233 << *More package options >> ≡
1234 \DeclareOption{math=active}{}
1235 \DeclareOption{math=normal}{{\def\bbl@mathnormal{\noexpand\textormath}}}
1236 << /More package options >>

```

Initiating a shorthand makes active the char. That is not strictly necessary but it is still done for backward compatibility. So we need to restore the original catcode at the end of package *and* the end of the *ldf*.

```

1237 \@ifpackagewith{babel}{KeepShorthandsActive}%
1238 {\let\bbl@restoreactive\@gobble}%
1239 {\def\bbl@restoreactive#1{%
1240   \bbl@exp{%
1241     \\AfterBabelLanguage\\CurrentOption
1242     {\catcode`#1=\the\catcode`#1\relax}%
1243     \\AtEndOfPackage
1244     {\catcode`#1=\the\catcode`#1\relax}}}%
1245   \AtEndOfPackage{\let\bbl@restoreactive\@gobble}}

```

**\bbl@sh@select** This command helps the shorthand supporting macros to select how to proceed. Note that this macro needs to be expandable as do all the shorthand macros in order for them to work in expansion-only environments such as the argument of \hyphenation.

This macro expects the name of a group of shorthands in its first argument and a shorthand character in its second argument. It will expand to either \bbl@firstcs or \bbl@scndcs. Hence two more arguments need to follow it.

```

1246 \def\bbl@sh@select#1#2{%
1247   \expandafter\ifx\csname#1@sh@#2@sel\endcsname\relax
1248     \bbl@afterelse\bbl@scndcs
1249   \else
1250     \bbl@afterfi\csname#1@sh@#2@sel\endcsname
1251   \fi}

```

**\active@prefix** Used in the expansion of active characters has a function similar to \OT1-cmd in that it \protects the active character whenever \protect is *not* \@typeset@protect. The \@gobble is needed to remove a token such as \activechar: (when the double colon was the active character to be dealt with). There are two definitions, depending of \ifincsname is available. If there is, the expansion will be more robust.

```

1252 \begingroup
1253 \bbl@ifunset{ifincsname}%^^A Ugly. Correct? Only Plain?
1254 {\gdef\active@prefix#1{%
1255   \ifx\protect\@typeset@protect

1278   \fi}}
1279 \endgroup

```

**if@safe@actives** In some circumstances it is necessary to be able to reset the shorthand to its ‘normal’ value (usually the character with catcode ‘other’) on the fly. For this purpose the switch @safe@actives is available. The setting of this switch should be checked in the first level expansion of \active@char⟨char⟩. When this expansion mode is active (with \@safe@activetrue), something like "13"13 becomes "12"12 in an \edef (in other words, shorthands are \string'ed). This contrasts

with `\protected@edef`, where catcodes are always left unchanged. Once converted, they can be used safely even after this expansion mode is deactivated (with `\@safe@activesfalse`).

```
1280 \newif\if@safe@actives
1281 \@safe@activesfalse
```

**\bbl@restore@actives** When the output routine kicks in while the active characters were made “safe” this must be undone in the headers to prevent unexpected typeset results. For this situation we define a command to make them “unsafe” again.

```
1282 \def\bbl@restore@actives{\if@safe@actives\@safe@activesfalse\fi}
```

**\bbl@activate**

**\bbl@deactivate** Both macros take one argument, like `\initiate@active@char`. The macro is used to change the definition of an active character to expand to `\active@char⟨char⟩` in the case of `\bbl@activate`, or `\normal@char⟨char⟩` in the case of `\bbl@deactivate`.

```
1283 \chardef\bbl@activated\z@
1284 \def\bbl@activate#1{%
1285   \chardef\bbl@activated\@ne
1286   \bbl@withactive{\expandafter\let\expandafter}#1%
1287   \csname bbl@active@\string#1\endcsname}
1288 \def\bbl@deactivate#1{%
1289   \chardef\bbl@activated\tw@
1290   \bbl@withactive{\expandafter\let\expandafter}#1%
1291   \csname bbl@normal@\string#1\endcsname}
```

**\bbl@firstcs**

**\bbl@scndcs** These macros are used only as a trick when declaring shorthands.

```
1292 \def\bbl@firstcs#1#2{\csname#1\endcsname}
1293 \def\bbl@scndcs#1#2{\csname#2\endcsname}
```

**\declare@shorthand** Used to declare a shorthand on a certain level. It takes three arguments:

1. a name for the collection of shorthands, i.e., ‘system’, or ‘dutch’;
2. the character (sequence) that makes up the shorthand, i.e., `~` or `"a`;
3. the code to be executed when the shorthand is encountered.

The auxiliary macro `\babel@texpdf` improves the interoperativity with `hyperref` and takes 4 arguments: (1) The  $\TeX$  code in text mode, (2) the string for `hyperref`, (3) the  $\TeX$  code in math mode, and (4), which is currently ignored, but it’s meant for a string in math mode, like a minus sign instead of an hyphen (currently `hyperref` doesn’t discriminate the mode). This macro may be used in `ldf` files.

```
1294 \def\babel@texpdf#1#2#3#4{%
1295   \ifx\texorpdfstring\undefined

1325      \fi}%
1326   \@namedef{#1@sh@\string#2@\string#3@}{#4}%
1327 \fi}

```

**\textormath** Some of the shorthands that will be declared by the language definition files have to be usable in both text and mathmode. To achieve this the helper macro `\textormath` is provided.

```

1328 \def\textormath{%
1329   \ifmmode
1330     \expandafter\@secondoftwo
1331   \else
1332     \expandafter\@firstoftwo
1333   \fi}

```

**\user@group**

**\language@group**

**\system@group** The current concept of ‘shorthands’ supports three levels or groups of shorthands. For each level the name of the level or group is stored in a macro. The default is to have a user group; use language group ‘english’ and have a system group called ‘system’.

```

1334 \def\user@group{user}
1335 \def\language@group{english} %^^A I don't like defaults
1336 \def\system@group{system}

```

**\usesshorthands** This is the user level macro. It initializes and activates the character for use as a shorthand character (i.e., it’s active in the preamble). Languages can deactivate shorthands, so a starred version is also provided which activates them always after the language has been switched.

```

1337 \def\usesshorthands{%
1338   \@ifstar\bbl@usesesh@s{\bbl@usesesh@x{}}
1339 \def\bbl@usesesh@s#1{%
1340   \bbl@usesesh@x
1341   {\AddBabelHook{babel-sh-\string#1}{afterextras}{\bbl@activate{#1}}}%
1342   {#1}}
1343 \def\bbl@usesesh@x#1#2{%

1347    #1%
1348    \bbl@activate{#2}}%
1349   {\bbl@error{shorthand-is-off}{#2}{}}}

```

**\defineshorthand** Currently we only support two groups of user level shorthands, named internally `user` and `user@(\language)` (language-dependent user shorthands). By default, only the first one is taken into account, but if the former is also used (in the optional argument of `\defineshorthand`) a new level is inserted for it (`user@generic`, done by `\bbl@set@user@generic`); we make also sure `{}` and `\protect` are taken into account in this new top level.

```

1350 \def\user@language@group{user@\language@group}
1351 \def\bbl@set@user@generic#1#2{%
1352   \bbl@ifunset{user@generic@active#1}%
1353   {\bbl@active@def#1\user@language@group{user@active}{user@generic@active}%

```

Usually the ~ is active and expands to `\penalty\M\L`. When it is written to the aux file it is written expanded. To prevent that and to be able to use the character ~ as a start character for a shorthand, it is redefined here as a one character shorthand on system level. The system declaration is in most cases redundant (when ~ is still a non-break space), and in some cases is inconvenient (if ~ has been redefined); however, for backward compatibility it is maintained (some existing documents may rely on the babel value).

```

1461 \initiate@active@char{~}
1462 \declare@shorthand{system}{~}{\leavevmode\nobreak\ }
1463 \bbl@activate{~}

```

## **\OT1dqpos**

**\T1dqpos** The position of the double quote character is different for the OT1 and T1 encodings. It will later be selected using the `\f@encoding` macro. Therefore we define two macros here to store the position of the character in these encodings.

```

1464 \expandafter\def\csname OT1dqpos\endcsname{127}
1465 \expandafter\def\csname T1dqpos\endcsname{4}

```

When the macro `\f@encoding` is undefined (as it is in plain  $\TeX$ ) we define it here to expand to OT1

```

1466 \ifx\f@encoding\undefined

1468 \fi

```

## 4.9. Language attributes

Language attributes provide a means to give the user control over which features of the language definition files he wants to enable.

**\languageattribute** The macro `\languageattribute` checks whether its arguments are valid and then activates the selected language attribute. First check whether the language is known, and then process each attribute in the list.

```

1469 \bbl@trace{Language attributes}
1470 \newcommand\languageattribute[2]{%
1471 \def\bbl@tempc{#1}%
1472 \bbl@fixname\bbl@tempc
1473 \bbl@iflanguage\bbl@tempc{%
1474 \bbl@vforeach{#2}{%

```

To make sure each attribute is selected only once, we store the already selected attributes in `\bbl@known@attribs`. When that control sequence is not yet defined this attribute is certainly not selected before.

```

1475 \ifx\bbl@known@attribs\undefined
1476 \in@false
1477 \else
1478 \bbl@xin@{\,\bbl@tempc-##1,}{\,\bbl@known@attribs,}%
1479 \fi

```

```

1480 \ifin@
1481 \bbl@warning{%
1482     You have more than once selected the attribute '##1'\%
1483     for language #1. Reported}%
1484 \else

```

When we end up here the attribute is not selected before. So, we add it to the list of selected attributes and execute the associated  $\TeX$ -code.

```

1485 \bbl@exp{%
1486     \\bbl@add@list\\bbl@known@attribs{\bbl@tempc-##1}}%
1487 \edef\bbl@tempa{\bbl@tempc-##1}%
1488 \expandafter\bbl@ifknown@ttrib\expandafter{\bbl@tempa}\bbl@attributes%
1489 {\csname\bbl@tempc @attr##1\endcsname}%
1490 {\@attrerr{\bbl@tempc}{##1}}%
1491 \fi}}}
1492 \@onlypreamble\languageattribute

```

The error text to be issued when an unknown attribute is selected.

```

1493 \newcommand*{\@attrerr}[2]{%
1494     \bbl@error{unknown-attribute}{#1}{#2}{}}

```

**$\backslash$ bbl@declare@ttribute** This command adds the new language/attribute combination to the list of known attributes.

Then it defines a control sequence to be executed when the attribute is used in a document. The result of this should be that the macro  $\backslash$ extras... for the current language is extended, otherwise the attribute will not work as its code is removed from memory at  $\backslash$ begin{document}.

```

1495 \def\bbl@declare@ttribute#1#2#3{%
1496     \bbl@xin@{, #2, }{\BabelModifiers,}%
1497 \ifin@
1498     \AfterBabelLanguage{#1}{\languageattribute{#1}{#2}}%
1499 \fi
1500 \bbl@add@list\bbl@attributes{#1-#2}%
1501 \expandafter\def\csname#1@attr@#2\endcsname{#3}}

```

**$\backslash$ bbl@ifattributeset** This internal macro has 4 arguments. It can be used to interpret  $\TeX$  code based on whether a certain attribute was set. This command should appear inside the argument to  $\backslash$ AtBeginDocument because the attributes are set in the document preamble, *after* babel is loaded.

The first argument is the language, the second argument the attribute being checked, and the third and fourth arguments are the true and false clauses.

```

1502 \def\bbl@ifattributeset#1#2#3#4{%
1503     \ifx\bbl@known@attribs\@undefined
1504         \in@false
1505     \else

1526     \let\bbl@attributes\undefined
1527   \fi}
1528 \def\bbl@clear@ttrib#1-#2.{%
1529   \expandafter\let\csname#1@attr@#2\endcsname\undefined}
1530 \AtBeginDocument{\bbl@clear@ttribs}

```

## 4.10. Support for saving and redefining macros

To save the meaning of control sequences using `\babel@save`, we use temporary control sequences. To save hash table entries for these control sequences, we don't use the name of the control sequence to be saved to construct the temporary name. Instead we simply use the value of a counter, which is reset to zero each time we begin to save new values. This works well because we release the saved meanings before we begin to save a new set of control sequence meanings (see `\selectlanguage` and `\originalTeX`). Note undefined macros are not undefined any more when saved – they are `\relax`'ed.

**\babel@savecnt**

**\babel@beginsave** The initialization of a new save cycle: reset the counter to zero.

```

1531 \bbl@trace{Macros for saving definitions}
1532 \def\babel@beginsave{\babel@savecnt\z@}

```

Before it's forgotten, allocate the counter and initialize all.

```

1533 \newcount\babel@savecnt
1534 \babel@beginsave

```

**\babel@save**

**\babel@savevariable** The macro `\babel@save<csname>` saves the current meaning of the control sequence `<csname>` to `\originalTeX` (which has to be expandable, i.e., you shouldn't let it to `\relax`). To do this, we let the current meaning to a temporary control sequence, the restore commands are appended to `\originalTeX` and the counter is incremented. The macro `\babel@savevariable<variable>` saves the value of the variable. `<variable>` can be anything allowed after the `\the` primitive. To avoid messing saved definitions up, they are saved only the very first time.

```

1535 \def\babel@save#1{%
1536   \def\bbl@tempa{{, #1,}}% Clumsy, for Plain
1537   \expandafter\bbl@add\expandafter\bbl@tempa\expandafter{%
1538     \expandafter{\expandafter, \bbl@savextras,}}%
1539   \expandafter\in@\bbl@tempa
1540   \ifin@ \else
1541     \bbl@add\bbl@savextras{, #1,}%
1542     \bbl@carg\let{\babel@number\babel@savecnt}#1\relax
1543     \toks@\expandafter{\originalTeX\let#1=}
1544     \bbl@exp{%
1545       \def\\originalTeX{\the\toks@<\babel@number\babel@savecnt>\relax}}%
1546     \advance\babel@savecnt@ne
1547   \fi}
1548 \def\babel@savevariable#1{%
1549   \toks@\expandafter{\originalTeX #1=}
1550   \bbl@exp{\def\\originalTeX{\the\toks@ \the#1\relax}}

```

**\bbl@redefine** To redefine a command, we save the old meaning of the macro. Then we redefine it to call the original macro with the ‘sanitized’ argument. The reason why we do it this way is that we don’t want to redefine the  $\TeX$  macros completely in case their definitions change (they have changed in the past). A macro named `\macro` will be saved new control sequences named `\org@macro`.

```
1551 \def\bbl@redefine#1{%
1552   \edef\bbl@tempa{\bbl@stripslash#1}%
1553   \expandafter\let\csname org@\bbl@tempa\endcsname#1%
1554   \expandafter\def\csname\bbl@tempa\endcsname}
1555 \@onlypreamble\bbl@redefine
```

**\bbl@redefine@long** This version of `\babel@redefine` can be used to redefine `\long` commands such as `\ifthenelse`.

```
1556 \def\bbl@redefine@long#1{%
1557   \edef\bbl@tempa{\bbl@stripslash#1}%
1558   \expandafter\let\csname org@\bbl@tempa\endcsname#1%
1559   \long\expandafter\def\csname\bbl@tempa\endcsname}
1560 \@onlypreamble\bbl@redefine@long
```

**\bbl@redefineroobust** For commands that are redefined, but which *might* be robust we need a slightly more intelligent macro. A robust command `foo` is defined to expand to `\protect\foo`. So it is necessary to check whether `\foo` exists. The result is that the command that is being redefined is always robust afterwards. Therefore all we need to do now is define `\foo`.

```
1561 \def\bbl@redefineroobust#1{%
1562   \edef\bbl@tempa{\bbl@stripslash#1}%
1563   \bbl@ifunset{\bbl@tempa\space}%
1564   {\expandafter\let\csname org@\bbl@tempa\endcsname#1%
1565    \bbl@exp{\def\#1{\protect\<\bbl@tempa\space>}}}%
1566   {\bbl@exp{\let\<org@\bbl@tempa>\<\bbl@tempa\space>}}}%
1567   \@namedef{\bbl@tempa\space}}
1568 \@onlypreamble\bbl@redefineroobust
```

## 4.11. French spacing

**\bbl@frenchspacing**

**\bbl@nonfrenchspacing** Some languages need to have `\frenchspacing` in effect. Others don’t want that. The command `\bbl@frenchspacing` switches it on when it isn’t already in effect and `\bbl@nonfrenchspacing` switches it off if necessary.

```
1569 \def\bbl@frenchspacing{%
1570   \ifnum\the\sfcode\.\=\@m
1571     \let\bbl@nonfrenchspacing\relax
1572   \else
1573     \frenchspacing
1574     \let\bbl@nonfrenchspacing\nonfrenchspacing
1575   \fi}
1576 \let\bbl@nonfrenchspacing\nonfrenchspacing
```

A more refined way to switch the catcodes is done with `ini` files. Here an auxiliary macro is defined, but the main part is in `\babelprovide`. This new method should be ideally the default one.

```
1577 \let\bbl@elt\relax
1578 \edef\bbl@fs@chars{%
1579   \bbl@elt{\string.}\@m{3000}\bbl@elt{\string?}\@m{3000}%
1580   \bbl@elt{\string!}\@m{3000}\bbl@elt{\string:}\@m{2000}%
1581   \bbl@elt{\string;}\@m{1500}\bbl@elt{\string,}\@m{1250}}
1582 \def\bbl@pre@fs{%
1583   \def\bbl@elt##1##2##3{\sfcode`##1=\the\sfcode`##1\relax}%
1584   \edef\bbl@save@sfcodes{\bbl@fs@chars}%
1585   \def\bbl@post@fs{%
1586     \bbl@save@sfcodes
1587     \edef\bbl@tempa{\bbl@cl{frspc}}%
1588     \edef\bbl@tempa{\expandafter\@car\bbl@tempa\@nil}%
1589   }
```

```

1589 \if u\bbbl@tempa      % do nothing
1590 \else\if n\bbbl@tempa  % non french
1591   \def\bbbl@elt##1##2##3{%
1592     \ifnum\sfcode`##1=##2\relax
1593       \babel@savevariable{\sfcode`##1}%
1594       \sfcode`##1=##3\relax
1595     \fi}%
1596   \bbbl@fs@chars
1597 \else\if y\bbbl@tempa    % french
1598   \def\bbbl@elt##1##2##3{%
1599     \ifnum\sfcode`##1=##3\relax
1600       \babel@savevariable{\sfcode`##1}%
1601       \sfcode`##1=##2\relax
1602     \fi}%
1603   \bbbl@fs@chars
1604 \fi\fi\fi}

```

## 4.12. Hyphens

**\babelhyphenation** This macro saves hyphenation exceptions. Two macros are used to store them: `\bbbl@hyphenation@` for the global ones and `\bbbl@hyphenation@<language>` for language ones. See `\bbbl@patterns` above for further details. We make sure there is a space between words when multiple commands are used.

```

1605 \bbbl@trace{Hyphens}
1606 \@onlypreamble\babelhyphenation
1607 \AtEndOfPackage{%
1608   \newcommand\babelhyphenation[2][\@empty]{%
1609     \ifx\bbbl@hyphenation@\relax
1610       \let\bbbl@hyphenation@\@empty
1611     \fi
1612     \ifx\bbbl@hyphlist\@empty\else
1613       \bbbl@warning{%
1614         You must not intermingle \string\selectlanguage\space and\\%
1615         \string\babelhyphenation\space or some exceptions will not\\%
1616         be taken into account. Reported}%
1617       \fi
1618       \ifx\@empty#1%
1619         \protected@edef\bbbl@hyphenation@{\bbbl@hyphenation@\space#2}%
1620       \else
1621         \bbbl@vforeach{#1}{%
1622           \def\bbbl@tempa{##1}%
1623           \bbbl@fixname\bbbl@tempa
1624           \bbbl@iflanguage\bbbl@tempa{%
1625             \bbbl@csarg\protected@edef{hyphenation@\bbbl@tempa}{%
1626               \bbbl@ifunset{\bbbl@hyphenation@\bbbl@tempa}%
1627               }{%
1628                 {\csname \bbbl@hyphenation@\bbbl@tempa\endcsname\space}%
1629                 #2}}}%
1630         \fi}}

```

**\babelhyphenmins** Only  $\text{\LaTeX}$  (basically because it's defined with a  $\text{\LaTeX}$  tool).

```

1631 \ifx\NewDocumentCommand\@undefined\else
1632   \NewDocumentCommand\babelhyphenmins{sommo}{%
1633     \IfNoValueTF{#2}%
1634       {\protected@edef\bbbl@hyphenmins@{\set@hyphenmins{#3}{#4}}}%
1635       \IfValueT{#5}{%
1636         \protected@edef\bbbl@hyphenatmin@{\hyphenationmin=#5\relax}}%
1637       \IfBooleanT{#1}{%
1638         \lefthyphenmin=#3\relax
1639         \righthyphenmin=#4\relax
1640         \IfValueT{#5}{\hyphenationmin=#5\relax}}}%
1641     {\edef\bbbl@tempb{\zap@space#2 \@empty}%

```

```

1642 \bbl@for\bbl@tempa\bbl@tempb{%
1643 \namedef\bbl@hyphenmins@bbl@tempa{\set@hyphenmins{#3}{#4}}%
1644 \IfValueT{#5}{%
1645 \namedef\bbl@hyphenatmin@bbl@tempa{\hyphenationmin=#5\relax}}}%
1646 \IfBooleanT{#1}{\bbl@error{hyphenmins-args}{}}{}}
1647 \fi

```

**\bbl@allowhyphens** This macro makes hyphenation possible. Basically its definition is nothing more than `\nobreak \hskip 0pt plus 0pt`.  $\TeX$  begins and ends a word for hyphenation at a glue node. The penalty prevents a linebreak at this glue node.

```

1648 \def\bbl@allowhyphens{\ifvmode\else\nobreak\hskip\z@skip\fi}
1649 \def\bbl@t@one{T1}
1650 \def\allowhyphens{\ifx\cf@encoding\bbl@t@one\else\bbl@allowhyphens\fi}

```

**\babelhyphen** Macros to insert common hyphens. Note the space before @ in `\babelhyphen`. Instead of protecting it with `\DeclareRobustCommand`, which could insert a `\relax`, we use the same procedure as shorthands, with `\active@prefix`.

```

1651 \newcommand\babelnullhyphen{\char\hyphenchar\font}
1652 \def\babelhyphen{\active@prefix\babelhyphen\bbl@hyphen}
1653 \def\bbl@hyphen{%
1654 \ifstar{\bbl@hyphen@i @}{\bbl@hyphen@i \@empty}}
1655 \def\bbl@hyphen@i#1#2{%
1656 \bbl@iifunset\bbl@hy@#1#2\@empty}%
1657 {\csname bbl@#1usehyphen\endcsname\discretionary{#2}{}{#2}}}%
1658 {\csname bbl@hy@#1#2\@empty\endcsname}}

```

The following two commands are used to wrap the “hyphen” and set the behavior of the rest of the word – the version with a single @ is used when further hyphenation is allowed, while that with @@ if no more hyphens are allowed. In both cases, if the hyphen is preceded by a positive space, breaking after the hyphen is disallowed.

There should not be a discretionary after a hyphen at the beginning of a word, so it is prevented if preceded by a skip. Unfortunately, this does handle cases like “(-suffix)”. `\nobreak` is always preceded by `\leavevmode`, in case the shorthand starts a paragraph.

```

1659 \def\bbl@usehyphen#1{%
1660 \leavevmode
1661 \ifdim\lastskip>\z@\mbox{#1}\else\nobreak#1\fi
1662 \nobreak\hskip\z@skip}
1663 \def\bbl@@usehyphen#1{%
1664 \leavevmode\ifdim\lastskip>\z@\mbox{#1}\else#1\fi}

```

The following macro inserts the hyphen char.

```

1665 \def\bbl@hyphenchar{%
1666 \ifnum\hyphenchar\font=\m@ne
1667 \babelnullhyphen
1668 \else
1669 \char\hyphenchar\font
1670 \fi}

```

Finally, we define the hyphen “types”. Their names will not change, so you may use them in `\ldf`’s. After a space, the `\mbox` in `\bbl@hy@nobreak` is redundant.

```

1671 \def\bbl@hy@soft{\bbl@usehyphen\discretionary{\bbl@hyphenchar}{}}{}}
1672 \def\bbl@hy@@soft{\bbl@usehyphen\discretionary{\bbl@hyphenchar}{}}{}}
1673 \def\bbl@hy@hard{\bbl@usehyphen\bbl@hyphenchar}
1674 \def\bbl@hy@@hard{\bbl@usehyphen\bbl@hyphenchar}
1675 \def\bbl@hy@nobreak{\bbl@usehyphen\mbox{\bbl@hyphenchar}}
1676 \def\bbl@hy@@nobreak{\mbox{\bbl@hyphenchar}}
1677 \def\bbl@hy@repeat{%
1678 \bbl@usehyphen%
1679 \discretionary{\bbl@hyphenchar}{\bbl@hyphenchar}{\bbl@hyphenchar}}
1680 \def\bbl@hy@@repeat{%
1681 \bbl@usehyphen%
1682 \discretionary{\bbl@hyphenchar}{\bbl@hyphenchar}{\bbl@hyphenchar}}

```

```

1683 \def\bbl@hy@empty{\hskip\z@skip}
1684 \def\bbl@hy@@empty{\discretionary{}{}{}}

```

**\bbl@disc** For some languages the macro \bbl@disc is used to ease the insertion of discretionary for letters that behave ‘abnormally’ at a breakpoint.

```

1685 \def\bbl@disc#1#2{\nobreak\discretionary{#2-}{}{#1}\bbl@allowhyphens}

```

## 4.13. Multiencoding strings

The aim following commands is to provide a common interface for strings in several encodings. They also contains several hooks which can be used by luatex and xetex. The code is organized here with pseudo-guards, so we start with the basic commands.

**Tools** But first, a tool. It makes global a local variable. This is not the best solution, but it works.

```

1686 \bbl@trace{Multiencoding strings}
1687 \def\bbl@tglobal#1{\global\let#1#1}

```

The following option is currently no-op. It was meant for the deprecated \SetCase.

```

1688 << *More package options >> ≡
1689 \DeclareOption{nocase}{}
1690 << /More package options >>

```

The following package options control the behavior of \SetString.

```

1691 << *More package options >> ≡
1692 \let\bbl@opt@strings\@nnil % accept strings=value
1693 \DeclareOption{strings}{\def\bbl@opt@strings{\BabelStringsDefault}}
1694 \DeclareOption{strings=encoded}{\let\bbl@opt@strings\relax}
1695 \def\BabelStringsDefault{generic}
1696 << /More package options >>

```

**Main command** This is the main command. With the first use it is redefined to omit the basic setup in subsequent blocks. We make sure strings contain actual letters in the range 128-255, not active characters.

```

1697 \@onlypreamble\StartBabelCommands
1698 \def\StartBabelCommands{%

1736 \let\bbbl@startcommands\StartBabelCommands

```

Parse the encoding info to get the label, input, and font parts.

Select the behavior of \SetString. There are two main cases, depending of if there is an optional argument: without it and strings=encoded, strings are defined always; otherwise, they are set only if they are still undefined (i.e., fallback values). With labelled blocks and strings=encoded, define the strings, but with another value, define strings only if the current label or font encoding is the value of strings; otherwise (i.e., no strings or a block whose label is not in strings=) do nothing.

We presume the current block is not loaded, and therefore set (above) a couple of default values to gobble the arguments. Then, these macros are redefined if necessary according to several parameters.

```

1793 \fi}

```

There are two versions of `\bbbl@scswitch`. The first version is used when `ldfs` are read, and it makes sure `\langle group \rangle \langle language \rangle` is reset, but only once (`\bbbl@screset` is used to keep track of this). The second version is used in the preamble and packages loaded after `babel` and does nothing.

The macro `\bbbl@forlang` loops `\bbbl@L` but its body is executed only if the value is in `\BabelLanguages` (inside `babel`) or `\date \langle language \rangle` is defined (after `babel` has been loaded). There are also two version of `\bbbl@forlang`. The first one skips the current iteration if the language is not in `\BabelLanguages` (used in `ldfs`), and the second one skips undefined languages (after `babel` has been loaded).

```

1794 \def\bbbl@forlang#1#2{%
1795 \bbbl@for#1\bbbl@L{%
1796 \bbbl@xin@{, #1, }{, \BabelLanguages,}%

1813 \@onlypreamble\EndBabelCommands
1814 \def\EndBabelCommands{%
1815 \bbbl@usehooks{stopcommands}{}%
1816 \endgroup
1817 \endgroup
1818 \bbbl@scafter}
1819 \let\bbbl@endcommands\EndBabelCommands

```

Now we define commands to be used inside `\StartBabelCommands`.

**Strings** The following macro is the actual definition of `\SetString` when it is “active”

First save the “switcher”. Create it if undefined. Strings are defined only if undefined (i.e., like `\providescommand`). With the event `stringprocess` you can preprocess the string by manipulating the value of `\BabelString`. If there are several hooks assigned to this event, preprocessing is done in the same order as defined. Finally, the string is set.

```

1820 \def\bbbl@setstring#1#2{% e.g., \prefacename{<string>}
1821 \bbbl@forlang\bbbl@tempa{%
1822 \edef\bbbl@LC{\bbbl@tempa\bbbl@stripslash#1}%
1823 \bbbl@ifunset{\bbbl@LC}% e.g., \germanchaptername

```

```

1824      {\bbl@exp{%
1825        \global\bbbl@add\<\bbl@G\bbl@tempa>{\bbbl@scset\#1\<\bbl@LC>}}}%
1826      }%
1827      \def\BabelString{#2}%
1828      \bbl@usehooks{stringprocess}{}%
1829      \expandafter\bbl@stringdef
1830      \csname\bbl@LC\expandafter\endcsname\expandafter{\BabelString}}

```

A little auxiliary command sets the string. Formerly used with casing. Very likely no longer necessary, although it's used in `\setlocalecaption`.

```

1831 \def\bbl@scset#1#2{\def#1{#2}}

```

Define `\SetStringLoop`, which is actually set inside `\StartBabelCommands`. The current definition is somewhat complicated because we need a count, but `\count@` is not under our control (remember `\SetString` may call hooks). Instead of defining a dedicated count, we just “pre-expand” its value.

```

1832 <<*Macros local to BabelCommands>> ≡
1833 \def\SetStringLoop##1##2{%
1834   \def\bbl@templ####1{\expandafter\noexpand\csname##1\endcsname}%
1835   \count@\z@
1836   \bbl@loop\bbl@tempa{##2}{% empty items and spaces are ok
1837     \advance\count@\@ne
1838     \toks@\expandafter{\bbl@tempa}%
1839     \bbl@exp{%
1840       \\SetString\bbl@templ{\romannumeral\count@}{\the\toks@}%
1841       \count@=\the\count@\relax}}}%
1842 <</Macros local to BabelCommands>>

```

**Delaying code** Now the definition of `\AfterBabelCommands` when it is activated.

```

1843 \def\bbl@aftercmds#1{%
1844   \toks@\expandafter{\bbl@scafter#1}%
1845   \xdef\bbl@scafter{\the\toks@}}

```

**Case mapping** The command `\SetCase` is deprecated. Currently it consists in a definition with a hack just for backward compatibility in the macro mapping.

```

1846 <<*Macros local to BabelCommands>> ≡
1847 \newcommand\SetCase[3][]{%
1848   \def\bbl@tempa####1####2{%
1849     \ifx####1@empty\else

```

## 4.15. Making glyphs available

This section makes a number of glyphs available that either do not exist in the OT1 encoding and have to be ‘faked’, or that are not accessible through Tlenc.def.

**\set@low@box** The following macro is used to lower quotes to the same level as the comma. It prepares its argument in box register 0.

```

1958 \bbl@trace{Macros related to glyphs}
1959 \def\set@low@box#1{\setbox\tw@hbox{,}\setbox\z@hbox{#1}%
1960     \dimen\z@ht\z@ \advance\dimen\z@ -\ht\tw@%
1961     \setbox\z@hbox{\lower\dimen\z@ \box\z@}\ht\z@ \ht\tw@ \dp\z@ \dp\tw@}

```

**\save@sf@q** The macro \save@sf@q is used to save and reset the current space factor.

```

1962 \def\save@sf@q#1{\leavevmode
1963     \begingroup
1964     \edef\@SF{\spacefactor\the\spacefactor}#1\@SF
1965     \endgroup}

```

### 4.15.1. Quotation marks

**\quotedblbase** In the T1 encoding the opening double quote at the baseline is available as a separate character, accessible via \quotedblbase. In the OT1 encoding it is not available, therefore we make it available by lowering the normal open quote character to the baseline.

```

1966 \ProvideTextCommand{\quotedblbase}{OT1}{%

```

```

1967 \save@sf@q{\set@low@box{\textquotedblright\}}%
1968 \box\z@\kern-.04em\bbbl@allowhyphens}}

```

Make sure that when an encoding other than OT1 or T1 is used this glyph can still be typeset.

```

1969 \ProvideTextCommandDefault{\quotedblbase}{%
1970 \UseTextSymbol{OT1}{\quotedblbase}}

```

**\quotesinglbase** We also need the single quote character at the baseline.

```

1971 \ProvideTextCommand{\quotesinglbase}{OT1}{%
1972 \save@sf@q{\set@low@box{\textquoteright\}}%
1973 \box\z@\kern-.04em\bbbl@allowhyphens}}

```

Make sure that when an encoding other than OT1 or T1 is used this glyph can still be typeset.

```

1974 \ProvideTextCommandDefault{\quotesinglbase}{%
1975 \UseTextSymbol{OT1}{\quotesinglbase}}

```

**\guillemetleft**

**\guillemetright** The guillemet characters are not available in OT1 encoding. They are faked. (Wrong names with o preserved for compatibility.)

```

1976 \ProvideTextCommand{\guillemetleft}{OT1}{%
1977 \ifmmode
1978 \ll
1979 \else
1980 \save@sf@q{\nobreak
1981 \raise.2ex\hbox{$\scriptscriptstyle\ll$}\bbbl@allowhyphens}%
1982 \fi}
1983 \ProvideTextCommand{\guillemetright}{OT1}{%
1984 \ifmmode
1985 \gg
1986 \else
1987 \save@sf@q{\nobreak
1988 \raise.2ex\hbox{$\scriptscriptstyle\gg$}\bbbl@allowhyphens}%
1989 \fi}
1990 \ProvideTextCommand{\guillemotleft}{OT1}{%
1991 \ifmmode
1992 \ll
1993 \else
1994 \save@sf@q{\nobreak
1995 \raise.2ex\hbox{$\scriptscriptstyle\ll$}\bbbl@allowhyphens}%
1996 \fi}
1997 \ProvideTextCommand{\guillemotright}{OT1}{%
1998 \ifmmode
1999 \gg
2000 \else
2001 \save@sf@q{\nobreak
2002 \raise.2ex\hbox{$\scriptscriptstyle\gg$}\bbbl@allowhyphens}%
2003 \fi}

```

Make sure that when an encoding other than OT1 or T1 is used these glyphs can still be typeset.

```

2004 \ProvideTextCommandDefault{\guillemetleft}{%
2005 \UseTextSymbol{OT1}{\guillemetleft}}
2006 \ProvideTextCommandDefault{\guillemetright}{%
2007 \UseTextSymbol{OT1}{\guillemetright}}
2008 \ProvideTextCommandDefault{\guillemotleft}{%
2009 \UseTextSymbol{OT1}{\guillemotleft}}
2010 \ProvideTextCommandDefault{\guillemotright}{%
2011 \UseTextSymbol{OT1}{\guillemotright}}

```

**\guilsinglleft**

**\guilsinglright** The single guillemets are not available in OT1 encoding. They are faked.

```
2012 \ProvideTextCommand{\guilsinglleft}{OT1}{%
2013   \ifmmode
2014     <%
2015   \else
2016     \save@sf@q{\nobreak
2017       \raise.2ex\hbox{$\scriptscriptstyle<$}\bbl@allowhyphens}%
2018   \fi}
2019 \ProvideTextCommand{\guilsinglright}{OT1}{%
2020   \ifmmode
2021     >%
2022   \else
2023     \save@sf@q{\nobreak
2024       \raise.2ex\hbox{$\scriptscriptstyle>$}\bbl@allowhyphens}%
2025   \fi}
```

Make sure that when an encoding other than OT1 or T1 is used these glyphs can still be typeset.

```
2026 \ProvideTextCommandDefault{\guilsinglleft}{%
2027   \UseTextSymbol{OT1}{\guilsinglleft}}
2028 \ProvideTextCommandDefault{\guilsinglright}{%
2029   \UseTextSymbol{OT1}{\guilsinglright}}
```

#### 4.15.2. Letters

**\ij**

**\IJ** The dutch language uses the letter ‘ij’. It is available in T1 encoded fonts, but not in the OT1 encoded fonts. Therefore we fake it for the OT1 encoding.

```
2030 \DeclareTextCommand{\ij}{OT1}{%
2031   i\kern-0.02em\bbl@allowhyphens j}
2032 \DeclareTextCommand{\IJ}{OT1}{%
2033   I\kern-0.02em\bbl@allowhyphens J}
2034 \DeclareTextCommand{\ij}{T1}{\char188}
2035 \DeclareTextCommand{\IJ}{T1}{\char156}
```

Make sure that when an encoding other than OT1 or T1 is used these glyphs can still be typeset.

```
2036 \ProvideTextCommandDefault{\ij}{%
2037   \UseTextSymbol{OT1}{\ij}}
2038 \ProvideTextCommandDefault{\IJ}{%
2039   \UseTextSymbol{OT1}{\IJ}}
```

**\dj**

**\DJ** The croatian language needs the letters \dj and \DJ; they are available in the T1 encoding, but not in the OT1 encoding by default.

Some code to construct these glyphs for the OT1 encoding was made available to me by Stipčević Mario, (stipcevic@olimp.irb.hr).

```
2040 \def\crrtic@{\hrule height0.1ex width0.3em}
2041 \def\crrtic@{\hrule height0.1ex width0.33em}
2042 \def\ddj@{%
2043   \setbox0\hbox{d}\dimen@=\ht0
2044   \advance\dimen@lex
2045   \dimen@.45\dimen@
2046   \dimen@ii\expandafter\rem@pt\the\fontdimen\@ne\font\dimen@
2047   \advance\dimen@ii.5ex
2048   \leavevmode\rlap{\raise\dimen@\hbox{\kern\dimen@ii\vbox{\crrtic@}}}}
2049 \def\DDJ@{%
2050   \setbox0\hbox{D}\dimen@=.55\ht0
2051   \dimen@ii\expandafter\rem@pt\the\fontdimen\@ne\font\dimen@
2052   \advance\dimen@ii.15ex % correction for the dash position
2053   \advance\dimen@ii-.15\fontdimen7\font % correction for cmtt font
2054   \dimen\thr@@\expandafter\rem@pt\the\fontdimen7\font\dimen@
2055   \leavevmode\rlap{\raise\dimen@\hbox{\kern\dimen@ii\vbox{\crrtic@}}}}
2056 %
```

```

2057 \DeclareTextCommand{\dj}{OT1}{\ddj@ d}
2058 \DeclareTextCommand{\DJ}{OT1}{\DDJ@ D}

```

Make sure that when an encoding other than OT1 or T1 is used these glyphs can still be typeset.

```

2059 \ProvideTextCommandDefault{\dj}{%
2060   \UseTextSymbol{OT1}{\dj}}
2061 \ProvideTextCommandDefault{\DJ}{%
2062   \UseTextSymbol{OT1}{\DJ}}

```

**\SS** For the T1 encoding \SS is defined and selects a specific glyph from the font, but for other encodings it is not available. Therefore we make it available here.

```

2063 \DeclareTextCommand{\SS}{OT1}{SS}
2064 \ProvideTextCommandDefault{\SS}{\UseTextSymbol{OT1}{\SS}}

```

### 4.15.3. Shorthands for quotation marks

Shorthands are provided for a number of different quotation marks, which make them usable both outside and inside mathmode. They are defined with \ProvideTextCommandDefault, but this is very likely not required because their definitions are based on encoding-dependent macros.

**\glq**

**\grq** The ‘german’ single quotes.

```

2065 \ProvideTextCommandDefault{\glq}{%
2066   \textormath{\quotesinglbase}{\mbox{\quotesinglbase}}}

```

The definition of \grq depends on the fontencoding. With T1 encoding no extra kerning is needed.

```

2067 \ProvideTextCommand{\grq}{T1}{%
2068   \textormath{\kern\z@\textquoteleft}{\mbox{\textquoteleft}}}
2069 \ProvideTextCommand{\grq}{TU}{%
2070   \textormath{\textquoteleft}{\mbox{\textquoteleft}}}
2071 \ProvideTextCommand{\grq}{OT1}{%
2072   \save@sf@q{\kern-.0125em
2073     \textormath{\textquoteleft}{\mbox{\textquoteleft}}}%
2074     \kern.07em\relax}}
2075 \ProvideTextCommandDefault{\grq}{\UseTextSymbol{OT1}\grq}

```

**\glqq**

**\grqq** The ‘german’ double quotes.

```

2076 \ProvideTextCommandDefault{\glqq}{%
2077   \textormath{\quotedblbase}{\mbox{\quotedblbase}}}

```

The definition of \grqq depends on the fontencoding. With T1 encoding no extra kerning is needed.

```

2078 \ProvideTextCommand{\grqq}{T1}{%
2079   \textormath{\textquotedblleft}{\mbox{\textquotedblleft}}}
2080 \ProvideTextCommand{\grqq}{TU}{%
2081   \textormath{\textquotedblleft}{\mbox{\textquotedblleft}}}
2082 \ProvideTextCommand{\grqq}{OT1}{%
2083   \save@sf@q{\kern-.07em
2084     \textormath{\textquotedblleft}{\mbox{\textquotedblleft}}}%
2085     \kern.07em\relax}}
2086 \ProvideTextCommandDefault{\grqq}{\UseTextSymbol{OT1}\grqq}

```

**\flq**

**\frq** The ‘french’ single guillemets.

```

2087 \ProvideTextCommandDefault{\flq}{%
2088   \textormath{\guilsinglleft}{\mbox{\guilsinglleft}}}
2089 \ProvideTextCommandDefault{\frq}{%
2090   \textormath{\guilsinglright}{\mbox{\guilsinglright}}}

```

**\flqq**

**\frqq** The ‘french’ double guillemets.

```
2091 \ProvideTextCommandDefault{\flqq}{%
2092   \textormath{\guillemetleft}{\mbox{\guillemetleft}}}
2093 \ProvideTextCommandDefault{\frqq}{%
2094   \textormath{\guillemetright}{\mbox{\guillemetright}}}
```

#### 4.15.4. Umlauts and tremas

The command `\` needs to have a different effect for different languages. For German for instance, the ‘umlaut’ should be positioned lower than the default position for placing it over the letters a, o, u, A, O and U. When placed over an e, i, E or I it can retain its normal position. For Dutch the same glyph is always placed in the lower position.

**\umlauthigh**

**\umlautlow** To be able to provide both positions of `\` we provide two commands to switch the positioning, the default will be `\umlauthigh` (the normal positioning).

```
2095 \def\umlauthigh{%
2096   \def\bbl@umlauta##1{\leavevmode\bgroup%
2097     \accent\csname\fontencoding dqpos\endcsname
2098     ##1\bbl@allowhyphens\egroup}%
2099   \let\bbl@umlaute\bbl@umlauta}
2100 \def\umlautlow{%
2101   \def\bbl@umlauta{\protect\lower@umlaut}}
2102 \def\umlautelow{%
2103   \def\bbl@umlaute{\protect\lower@umlaut}}
2104 \umlauthigh
```

**\lower@umlaut** Used to position the `\` closer to the letter. We want the umlaut character lowered, nearer to the letter. To do this we need an extra *<dimen>* register.

```
2105 \expandafter\ifx\csname U@D\endcsname\relax
2106   \csname newdimen\endcsname U@D
2107 \fi
```

The following code fools TeX’s `make\_accent` procedure about the current x-height of the font to force another placement of the umlaut character. First we have to save the current x-height of the font, because we’ll change this font dimension and this is always done globally.

Then we compute the new x-height in such a way that the umlaut character is lowered to the base character. The value of `.45ex` depends on the METAFONT parameters with which the fonts were built. (Just try out, which value will look best.) If the new x-height is too low, it is not changed. Finally we call the `\accent` primitive, reset the old x-height and insert the base character in the argument.

```
2108 \def\lower@umlaut#1{%
2109   \leavevmode\bgroup
2110   \U@D lex%
2111   {\setbox\z@\hbox{%
2112     \char\csname\fontencoding dqpos\endcsname}%
2113     \dimen@ -.45ex\advance\dimen@\ht\z@
2114     \ifdim lex<\dimen@ \fontdimen5\font\dimen@ \fi}%
2115   \accent\csname\fontencoding dqpos\endcsname
2116   \fontdimen5\font\U@D #1%
2117   \egroup}
```

For all vowels we declare `\` to be a composite command which uses `\bbl@umlauta` or `\bbl@umlaute` to position the umlaut character. We need to be sure that these definitions override the ones that are provided when the package `fontenc` with option `OT1` is used. Therefore these declarations are postponed until the beginning of the document. Note these definitions only apply to some languages, but `babel` sets them for *all* languages – you may want to redefine `\bbl@umlauta` and/or `\bbl@umlaute` for a language in the corresponding `ldf` (using the `babel` switching mechanism, of course).

```
2118 \AtBeginDocument{%
2119   \DeclareTextCompositeCommand{\}{OT1}{a}{\bbl@umlauta{a}}%
2120   \DeclareTextCompositeCommand{\}{OT1}{e}{\bbl@umlaute{e}}%
2121   \DeclareTextCompositeCommand{\}{OT1}{i}{\bbl@umlaute{i}}%
```

```

2122 \DeclareTextCompositeCommand{"}{OT1}{\i}{\bbl@umlaut{i}}%
2123 \DeclareTextCompositeCommand{"}{OT1}{o}{\bbl@umlaut{o}}%
2124 \DeclareTextCompositeCommand{"}{OT1}{u}{\bbl@umlaut{u}}%
2125 \DeclareTextCompositeCommand{"}{OT1}{A}{\bbl@umlaut{A}}%
2126 \DeclareTextCompositeCommand{"}{OT1}{E}{\bbl@umlaut{E}}%
2127 \DeclareTextCompositeCommand{"}{OT1}{I}{\bbl@umlaut{I}}%
2128 \DeclareTextCompositeCommand{"}{OT1}{O}{\bbl@umlaut{O}}%
2129 \DeclareTextCompositeCommand{"}{OT1}{U}{\bbl@umlaut{U}}%

```

Finally, make sure the default hyphenrules are defined (even if empty). For internal use, another empty `\language` is defined. Currently used in Amharic.

```

2130 \ifx\l@english\@undefined
2131 \chardef\l@english\z@
2132 \fi
2133 % The following is used to cancel rules in ini files (see Amharic).
2134 \ifx\l@unhyphenated\@undefined
2135 \newlanguage\l@unhyphenated
2136 \fi

```

## 4.16. Layout

Layout is mainly intended to set bidi documents, but there is at least a tool useful in general.

```

2137 \bbl@trace{Bidi layout}
2138 \providecommand\IfBabelLayout[3]{#3}%

```

## 4.17. Load engine specific macros

Some macros are not defined in all engines, so, after loading the files define them if necessary to raise an error.

```

2139 \bbl@trace{Input engine specific macros}
2140 \ifcase\bbl@engine
2141 \input txtbabel.def
2142 \or
2143 \input luababel.def

2151 \let\babelpatterns\babelprehyphenation
2152 \let\babelcharproperty\babelprehyphenation
2153 \fi
2154 </package | core>

```

## 4.18. Creating and modifying languages

Continue with  $\LaTeX$  only.

`\babelprovide` is a general purpose tool for creating and modifying languages. It creates the language infrastructure, and loads, if requested, an ini file. It may be used in conjunction to previously loaded ldf files.

```

2155 <*package>
2156 \bbl@trace{Creating languages and reading ini files}
2157 \let\bbl@extend@ini\gobble

#### 4.19. Main loop in ‘provide’

Now, the ‘main loop’, which **\*\*must be executed inside a group\*\***. At this point, \bbl@inidata may contain data declared in \babelprovide, with ‘slashed’ keys. There are 3 steps: first read the ini file and store it; then traverse the stored values, and process some groups if required (date, captions, labels, counters); finally, ‘export’ some values by defining global macros (identification, typography, characters, numbers). The second argument is 0 when called to read the minimal data for fonts; with \babelprovide it’s either 1 or 2.

```

Key-value pairs are treated differently depending on the section in the ini file. The following macros are the readers for identification and typography. Note `\bbl@ini@exports` is called always (via `\bbl@inisec`), while `\bbl@after@ini` must be called explicitly after `\bbl@read@ini` if necessary.

Although BCP 47 doesn't treat 'x-' as an extension, the CLDR and many other sources do (as a *private use extension*). For consistency with other single-letter subtags or 'singletons', here is considered an extension, too.

**Dates** will require some macros for the basic formatting. They may be redefined by language, so “semi-public” names (camel case) are used. Oddly enough, the CLDR places particles like “de” inconsistently in either in the date or in the month name. Note after `\bbl@replace \toks@` contains the resulting string, which is used by `\bbl@replace@finish@iii` (this implicit behavior doesn't seem a good idea, but it's efficient).

3197     \fi\fi
3198     \fi}%
3199     {\hyphenchar\font\defaultthyphenchar}}
3200 % \fi}

```

The following ini reader ignores everything but the identification section. It is called when a font is defined (i.e., when the language is first selected) to know which script/language must be enabled. This means we must make sure a few characters are not active. The ini is not read directly,

but with a proxy tex file named as the language (which means any code in it must be skipped, too).

```

3201 \def\bbl@load@info#1{%
3202   \def\BabelBeforeIni##1##2{%
3203     \begingroup
3204       \bbl@read@ini{##1}0%
3205       \endinput           % babel- .tex may contain onlypreamble's
3206       \endgroup}%         boxed, to avoid extra spaces:
3207   {\bbl@input@texini{##1}}}
```

## 4.23. Numerals

A tool to define the macros for native digits from the list provided in the ini file. Somewhat convoluted because there are 10 digits, but only 9 arguments in T<sub>E</sub>X. Non-digits characters are kept. The first macro is the generic “localized” command.

```

3208 \def\bbl@setdigits#1#2#3#4#5{%
3209   \bbl@exp{%
3210     \def<\language name digits>####1{%      i.e., \langdigits

3228           \\\else\\\ifx4#####1#5%
3229           \\\else\\\ifx5#####1#1%
3230           \\\else\\\ifx6#####1#2%
3231           \\\else\\\ifx7#####1#3%
3232           \\\else\\\ifx8#####1#4%
3233           \\\else\\\ifx9#####1#5%
3234           \\\else#####1%
3235           \\\fi\\\fi\\\fi\\\fi\\\fi\\\fi\\\fi\\\fi\\\fi\\\fi
3236           \\\expandafter\<bbl@digits@\language name>%
3237           \\\fi}}}%
3238   \bbl@tempa}
```

Alphabetic counters must be converted from a space separated list to an \ifcase structure.

```

3239 \def\bbl@buildifcase#1 {% Returns \bbl@tempa, requires \toks@={ }
3240   \ifx\\#1%          % \ before, in case #1 is multiletter
3241     \bbl@exp{%
3242       \def\\\bbl@tempa####1{%
3243         \<ifcase>####1\space\the\toks@\<else>\\\@ctrerr\<fi>}}%
3244     \else
3245       \toks@\expandafter{\the\toks@\or #1}%
3246       \expandafter\bbl@buildifcase
3247     \fi}
```

The code for additive counters is somewhat tricky and it's based on the fact the arguments just before @@ collect digits which have been left ‘unused’ in previous arguments, the first of them being the number of digits in the number to be converted. This explains the reverse set 76543210. Digits above 10000 are not handled yet. When the key contains the subkey .F., the number after is treated as an special case, for a fixed form (see babel-he.ini, for example).

```

## 5.1. Cross referencing macros

The  $\LaTeX$  book states:

The *key* argument is any sequence of letters, digits, and punctuation symbols; upper- and lowercase letters are regarded as different.

When the above quote should still be true when a document is typeset in a language that has active characters, special care has to be taken of the category codes of these characters when they appear in an argument of the cross referencing macros.

When a cross referencing command processes its argument, all tokens in this argument should be character tokens with category ‘letter’ or ‘other’.

The following package options control which macros are to be redefined.

```

3560 << *More package options >> ≡
3561 \DeclareOption{safe=none}{\let\bbl@opt@safe\@empty}
3562 \DeclareOption{safe=bib}{\def\bbl@opt@safe{B}}
3563 \DeclareOption{safe=ref}{\def\bbl@opt@safe{R}}
3564 \DeclareOption{safe=refbib}{\def\bbl@opt@safe{BR}}
3565 \DeclareOption{safe=bibref}{\def\bbl@opt@safe{BR}}
3566 << /More package options >>

```

**\@newl@bel** First we open a new group to keep the changed setting of `\protect` local and then we set the `@safe@actives` switch to true to make sure that any shorthand that appears in any of the arguments immediately expands to its non-active self.

```

3567 \bbl@trace{Cross referencing macros}
3568 \ifx\bbl@opt@safe\@empty\else % i.e., if 'ref' and/or 'bib'
3569   \def\@newl@bel#1#2#3{%
3570     {\@safe@activetrue
3571       \bbl@ifunset{#1@#2}%
3572       \relax
3573       {\gdef\@multiplelabels{%
3574         \@latex@warning@no@line{There were multiply-defined labels}}%
3575         \@latex@warning@no@line{Label `#2' multiply defined}}%
3576       \global\@namedef{#1@#2}{#3}}}%

```

**\@testdef** An internal  $\LaTeX$  macro used to test if the labels that have been written on the aux file have changed. It is called by the `\enddocument` macro.

```

3577 \CheckCommand*\@testdef[3]{%
3578   \def\reserved@a{#3}%

```

```

3579 \expandafter\ifx\csname#1@#2\endcsname\reserved@a
3580 \else
3581 \@tempswattrue
3582 \fi}

```

Now that we made sure that \@testdef still has the same definition we can rewrite it. First we make the shorthands ‘safe’. Then we use \bbl@tempa as an ‘alias’ for the macro that contains the label which is being checked. Then we define \bbl@tempb just as \@newl@bel does it. When the label is defined we replace the definition of \bbl@tempa by its meaning. If the label didn’t change, \bbl@tempa and \bbl@tempb should be identical macros.

```

3583 \def\@testdef#1#2#3{% TODO. With @samestring?
3584 \@safe@activesttrue
3585 \expandafter\let\expandafter\bbl@tempa\csname #1@#2\endcsname
3586 \def\bbl@tempb{#3}%
3587 \@safe@activestfalse
3588 \ifx\bbl@tempa\relax
3589 \else
3590 \edef\bbl@tempa{\expandafter\strip@prefix\meaning\bbl@tempa}%
3591 \fi
3592 \edef\bbl@tempb{\expandafter\strip@prefix\meaning\bbl@tempb}%
3593 \ifx\bbl@tempa\bbl@tempb
3594 \else
3595 \@tempswattrue
3596 \fi}
3597 \fi

```

## **\ref**

**\pageref** The same holds for the macro \ref that references a label and \pageref to reference a page. We make them robust as well (if they weren’t already) to prevent problems if they should become expanded at the wrong moment.

```

3598 \bbl@xin@{R}\bbl@opt@safe
3599 \ifin@
3600 \edef\bbl@tempc{\expandafter\string\csname ref code\endcsname}%
3601 \bbl@xin@{\expandafter\strip@prefix\meaning\bbl@tempc}%
3602 {\expandafter\strip@prefix\meaning\ref}%
3603 \ifin@
3604 \bbl@redefine\@kernel@ref#1{%
3605 \@safe@activesttrue\org@@kernel@ref{#1}\@safe@activestfalse}
3606 \bbl@redefine\@kernel@pageref#1{%
3607 \@safe@activesttrue\org@@kernel@pageref{#1}\@safe@activestfalse}
3608 \bbl@redefine\@kernel@sref#1{%
3609 \@safe@activesttrue\org@@kernel@sref{#1}\@safe@activestfalse}
3610 \bbl@redefine\@kernel@spageref#1{%
3611 \@safe@activesttrue\org@@kernel@spageref{#1}\@safe@activestfalse}
3612 \else
3613 \bbl@redefineroobust\ref#1{%
3614 \@safe@activesttrue\org@ref{#1}\@safe@activestfalse}
3615 \bbl@redefineroobust\pageref#1{%
3616 \@safe@activesttrue\org@pageref{#1}\@safe@activestfalse}
3617 \fi
3618 \else
3619 \let\org@ref\ref
3620 \let\org@pageref\pageref
3621 \fi

```

**\@citex** The macro used to cite from a bibliography, \cite, uses an internal macro, \@citex. It is this internal macro that picks up the argument(s), so we redefine this internal macro and leave \cite alone. The first argument is used for typesetting, so the shorthands need only be deactivated in the second argument.

```

3622 \bbl@xin@{B}\bbl@opt@safe
3623 \ifin@
3624 \bbl@redefine\@citex[#1]#2{%

```

```

3625 \@safe@activetrue\edef\bbl@tempa{#2}\@safe@activetruefalse
3626 \org@citex[#1]{\bbl@tempa}}

```

Unfortunately, the packages `natbib` and `cite` need a different definition of `\@citex`... To begin with, `natbib` has a definition for `\@citex` with *three* arguments... We only know that a package is loaded when `\begin{document}` is executed, so we need to postpone the different redefinition.

Notice that we use `\def` here instead of `\bbl@redefine` because `\org@citex` is already defined and we don't want to overwrite that definition (it would result in parameter stack overflow because of a circular definition).

(Recent versions of `natbib` change dynamically `\@citex`, so PR4087 doesn't seem fixable in a simple way. Just load `natbib` before.)

```

3627 \AtBeginDocument{%
3628 \ifpackageloaded{natbib}{%
3629 \def\@citex[#1][#2]#3{%
3630 \@safe@activetrue\edef\bbl@tempa{#3}\@safe@activetruefalse
3631 \org@citex[#1][#2]{\bbl@tempa}}%
3632 }{}}

```

The package `cite` has a definition of `\@citex` where the shorthands need to be turned off in both arguments.

```

3633 \AtBeginDocument{%
3634 \ifpackageloaded{cite}{%
3635 \def\@citex[#1]#2{%
3636 \@safe@activetrue\org@citex[#1][#2]\@safe@activetruefalse}%
3637 }{}}

```

**\nocite** The macro `\nocite` which is used to instruct BiB<sub>T</sub><sub>X</sub> to extract uncited references from the database.

```

3638 \bbl@redefine\nocite#1{%
3639 \@safe@activetrue\org@nocite{#1}\@safe@activetruefalse}

```

**\bibcite** The macro that is used in the aux file to define citation labels. When packages such as `natbib` or `cite` are not loaded its second argument is used to typeset the citation label. In that case, this second argument can contain active characters but is used in an environment where `\@safe@activetrue` is in effect. This switch needs to be reset inside the `\hbox` which contains the citation label. In order to determine during aux file processing which definition of `\bibcite` is needed we define `\bibcite` in such a way that it redefines itself with the proper definition. We call `\bbl@cite@choice` to select the proper definition for `\bibcite`. This new definition is then activated.

```

3640 \bbl@redefine\bibcite{%
3641 \bbl@cite@choice
3642 \bibcite}

```

**\bbl@bibcite** The macro `\bbl@bibcite` holds the definition of `\bibcite` needed when neither `natbib` nor `cite` is loaded.

```

3643 \def\bbl@bibcite#1#2{%
3644 \org@bibcite{#1}{\@safe@activetruefalse#2}}

```

**\bbl@cite@choice** The macro `\bbl@cite@choice` determines which definition of `\bibcite` is needed. First we give `\bibcite` its default definition.

```

3645 \def\bbl@cite@choice{%
3646 \global\let\bibcite\bbl@bibcite
3647 \ifpackageloaded{natbib}{\global\let\bibcite\org@bibcite}}%
3648 \ifpackageloaded{cite}{\global\let\bibcite\org@bibcite}}%
3649 \global\let\bbl@cite@choice\relax}

```

When a document is run for the first time, no aux file is available, and `\bibcite` will not yet be properly defined. In this case, this has to happen before the document starts.

```

3650 \AtBeginDocument{\bbl@cite@choice}

```

**\@bibitem** One of the two internal  $\TeX$  macros called by `\bibitem` that write the citation label on the aux file.

```

3651 \bbl@redefine\@bibitem#1{%
3652   \safe@activetrue\org@bibitem{#1}\safe@activesfalse}
3653 \else
3654   \let\org@nocite\nocite
3655   \let\org@@citex\@citex
3656   \let\org@bibcite\@bibcite
3657   \let\org@bibitem\@bibitem
3658 \fi

```

## 5.2. Layout

```

3659 \newcommand\BabelPatchSection[1]{%

```

## 5.3. Marks

**\markright** Because the output routine is asynchronous, we must pass the current language attribute to the head lines. To achieve this we need to adapt the definition of `\markright` and `\markboth` somewhat. However, headlines and footlines can contain text outside marks; for that we must take some actions in the output routine if the 'headfoot' options is used.

We need to make some redefinitions to the output routine to avoid an endless loop and to correctly handle the page number in bidi documents.

```

3692 \bbl@trace{Marks}
3693 \IfBabelLayout{sectioning}
3694   {\ifx\bbl@opt@headfoot\@nnil
3695     \g@addto@macro\@resetactivechars{%
3696       \set@typeset@protect
3697       \expandafter\select@language@x\expandafter{\bbl@main@language}%
3698       \let\protect\@noexpand
3699       \ifcase\bbl@bidimode\else % Only with bidi. See also above

```

```

3700         \edef\thepage{%
3701             \noexpand\babelsublr{\unexpanded\expandafter{\thepage}}}%
3702         \fi}%
3703     \fi}
3704     {\ifbbl@single\else
3705         \bbl@ifunset{markright } \bbl@redefine\bbl@redefineroobust
3706         \markright#1{%
3707             \bbl@ifblank{#1}%
3708             {\org@markright{}}%
3709             {\toks@{#1}%
3710             \bbl@exp{%
3711                 \\org@markright{\\protect\\foreignlanguage{\language}%
3712                 {\protect\\bbl@restore@actives\the\toks@}}}%

```

## **\markboth**

**\@mkboth** The definition of `\markboth` is equivalent to that of `\markright`, except that we need two token registers. The documentclasses report and book define and set the headings for the page. While doing so they also store a copy of `\markboth` in `\@mkboth`. Therefore we need to check whether `\@mkboth` has already been set. If so we need to do that again with the new definition of `\markboth`. (As of Oct 2019,  $\TeX$  stores the definition in an intermediate macro, so it's not necessary anymore, but it's preserved for older versions.)

```

3713     \ifx\@mkboth\markboth
3714         \def\bbl@tempc{\let\@mkboth\markboth}%
3715     \else
3716         \def\bbl@tempc{%
3717             \fi
3718             \bbl@ifunset{markboth } \bbl@redefine\bbl@redefineroobust
3719             \markboth#1#2{%
3720                 \protected@edef\bbl@tempb##1{%
3721                     \protect\foreignlanguage
3722                     {\language}{\protect\bbl@restore@actives##1}}%
3723                 \bbl@ifblank{#1}%
3724                 {\toks@{}}%
3725                 {\toks@\expandafter{\bbl@tempb{#1}}}%
3726                 \bbl@ifblank{#2}%
3727                 {\@temptokena{}}%
3728                 {\@temptokena\expandafter{\bbl@tempb{#2}}}%
3729                 \bbl@exp{\\org@markboth{\the\toks@}{\the\@temptokena}}}%
3730                 \bbl@tempc
3731             \fi} % end ifbbl@single, end \IfBabelLayout

```

## 5.4. Other packages

### 5.4.1. ifthen

**\ifthenelse** Sometimes a document writer wants to create a special effect depending on the page a certain fragment of text appears on. This can be achieved by the following piece of code:

```

% \ifthenelse{\isodd{\pageref{some-label}}}
%         {code for odd pages}
%         {code for even pages}
%

```

In order for this to work the argument of `\isodd` needs to be fully expandable. With the above redefinition of `\pageref` it is not in the case of this example. To overcome that, we add some code to the definition of `\ifthenelse` to make things work.

We want to revert the definition of `\pageref` and `\ref` to their original definition for the first argument of `\ifthenelse`, so we first need to store their current meanings.

Then we can set the `\@safe@actives` switch and call the original `\ifthenelse`. In order to be able to use shorthands in the second and third arguments of `\ifthenelse` the resetting of the switch *and* the definition of `\pageref` happens inside those arguments.

```

3732 \bbl@trace{Preventing clashes with other packages}

```

```

3733 \ifx\org@ref\@undefined\else
3734 \bbl@xin@{R}\bbl@opt@safe
3735 \ifin@
3736 \AtBeginDocument{%
3737 \ifpackageloaded{ifthen}{%
3738 \bbl@redefine@long\ifthenelse#1#2#3{%
3739 \let\bbl@temp@pref\pageref
3740 \let\pageref\org@pageref
3741 \let\bbl@temp@ref\ref
3742 \let\ref\org@ref
3743 \@safe@activetrue
3744 \org@ifthenelse{#1}%
3745 {\let\pageref\bbl@temp@pref
3746 \let\ref\bbl@temp@ref
3747 \@safe@activesfalse
3748 #2}%
3749 {\let\pageref\bbl@temp@pref
3750 \let\ref\bbl@temp@ref
3751 \@safe@activesfalse
3752 #3}%
3753 }%
3754 }{}%
3755 }
3756 \fi

```

#### 5.4.2. varioref

**\@@vpageref**

**\vrefpagenum**

**\Ref** When the package varioref is in use we need to modify its internal command \@@vpageref in order to prevent problems when an active character ends up in the argument of \vref. The same needs to happen for \vrefpagenum.

```

3757 \AtBeginDocument{%
3758 \ifpackageloaded{varioref}{%
3759 \bbl@redefine\@@vpageref#1[#2]#3{%
3760 \@safe@activetrue
3761 \org@@@vpageref{#1}[#2]#3}%
3762 \@safe@activesfalse}%
3763 \bbl@redefine\vrefpagenum#1#2{%
3764 \@safe@activetrue
3765 \org@vrefpagenum{#1}#2}%
3766 \@safe@activesfalse}%

```

The package varioref defines \Ref to be a robust command which uppercases the first character of the reference text. In order to be able to do that it needs to access the expandable form of \ref. So we employ a little trick here. We redefine the (internal) command \Ref\_ to call \org@ref instead of \ref. The disadvantage of this solution is that whenever the definition of \Ref changes, this definition needs to be updated as well.

```

3767 \expandafter\def\csname Ref \endcsname#1{%
3768 \protected@edef\@tempa{\org@ref{#1}}\expandafter\MakeUppercase\@tempa}
3769 }{}%
3770 }
3771 \fi

```

#### 5.4.3. hhl ine

**\hhl ine** Delaying the activation of the shorthand characters has introduced a problem with the hhl ine package. The reason is that it uses the ‘:’ character which is made active by the french support in babel. Therefore we need to *reload* the package when the ‘:’ is an active character. Note that this happens *after* the category code of the @-sign has been changed to other, so we need to temporarily change it to letter again.

```

## 5.5. Encoding and fonts

Because documents may use non-ASCII font encodings, we make sure that the logos of  $\text{\TeX}$  and  $\text{\LaTeX}$  always come out in the right encoding. There is a list of non-ASCII encodings. Requested encodings are currently stored in `\@fontenc@load@list`. If a non-ASCII has been loaded, we define versions of `\TeX` and `\LaTeX` for them using `\ensureascii`. The default ASCII encoding is set, too (in reverse order): the “main” encoding (when the document begins), the last loaded, or OT1.

### **\ensureascii**

```

3800 \bbl@trace{Encoding and fonts}
3801 \newcommand\BabelNonASCII{LGR,LGI,X2,OT2,OT3,OT6,LHE,LWN,LMA,LMC,LMS,LMU}
3802 \newcommand\BabelNonText{TS1,T3,TS3}
3803 \let\org@TeX\TeX
3804 \let\org@LaTeX\LaTeX
3805 \let\ensureascii@firstofone
3806 \let\asciiencoding\@empty
3807 \AtBeginDocument{%
3808   \def\@elt#1{, #1,}%
3809   \edef\bbl@tempa{\expandafter\@gobbletwo\@fontenc@load@list}%
3810   \let\@elt\relax
3811   \let\bbl@tempb\@empty
3812   \def\bbl@tempc{OT1}%
3813   \bbl@foreach\BabelNonASCII{% LGR loaded in a non-standard way
3814     \bbl@ifunset{T@#1}{\def\bbl@tempb{#1}}}%
3815   \bbl@foreach\bbl@tempa{%
3816     \bbl@xin@{, #1,}{, \BabelNonASCII,}%
3817     \ifin@
3818       \def\bbl@tempb{#1}% Store last non-ascii
3819     \else\bbl@xin@{, #1,}{, \BabelNonText,}% Pass
3820     \ifin@else

```

```

3821     \def\bbl@tempc{#1}% Store last ascii
3822     \fi
3823     \fi}%
3824     \ifx\bbl@tempb\@empty\else
3825     \bbl@xin@{,\cf@encoding,}{,\BabelNonASCII,\BabelNonText,}%
3826     \ifin@else
3827     \edef\bbl@tempc{\cf@encoding}% The default if ascii wins
3828     \fi
3829     \let\asciientcoding\bbl@tempc
3830     \renewcommand\ensureascii[1]{%
3831     {\fontencoding{\asciientcoding}\selectfont#1}}%
3832     \DeclareTextCommandDefault{\TeX}{\ensureascii{\org@TeX}}%
3833     \DeclareTextCommandDefault{\LaTeX}{\ensureascii{\org@LaTeX}}%
3834     \fi}

```

Now comes the old deprecated stuff (with a little change in 3.9l, for fontspec). The first thing we need to do is to determine, at `\begin{document}`, which latin fontencoding to use.

**\latinencoding** When text is being typeset in an encoding other than ‘latin’ (OT1 or T1), it would be nice to still have Roman numerals come out in the Latin encoding. So we first assume that the current encoding at the end of processing the package is the Latin encoding.

```

3835 \AtEndOfPackage{\edef\latinencoding{\cf@encoding}}

```

But this might be overruled with a later loading of the package fontenc. Therefore we check at the execution of `\begin{document}` whether it was loaded with the T1 option. The normal way to do this (using `\@ifpackageloaded`) is disabled for this package. Now we have to revert to parsing the internal macro `\@filelist` which contains all the filenames loaded.

```

3836 \AtBeginDocument{%
3837   \@ifpackageloaded{fontspec}%
3838   {\xdef\latinencoding{%
3839     \ifx\UTFencname\@undefined
3840     EU\ifcase\bbl@engine\or2\or1\fi
3841     \else
3842     \UTFencname
3843     \fi}}%
3844   {\gdef\latinencoding{OT1}%
3845     \ifx\cf@encoding\bbl@t@one
3846     \xdef\latinencoding{\bbl@t@one}%
3847     \else
3848     \def\@elt#1{,#1,}%
3849     \edef\bbl@tempa{\expandafter\@gobbletwo\@fontenc@load@list}%
3850     \let\@elt\relax
3851     \bbl@xin@{,T1,}\bbl@tempa
3852     \ifin@
3853     \xdef\latinencoding{\bbl@t@one}%
3854     \fi
3855     \fi}}

```

**\latintext** Then we can define the command `\latintext` which is a declarative switch to a latin font-encoding. Usage of this macro is deprecated.

```

3856 \DeclareRobustCommand{\latintext}{%
3857   \fontencoding{\latinencoding}\selectfont
3858   \def\encodingdefault{\latinencoding}}

```

**\textlatin** This command takes an argument which is then typeset using the requested font encoding. In order to avoid many encoding switches it operates in a local scope.

```

3859 \ifx\@undefined\DeclareTextFontCommand
3860   \DeclareRobustCommand{\textlatin}[1]{\leavevmode{\latintext #1}}
3861 \else
3862   \DeclareTextFontCommand{\textlatin}{\latintext}
3863 \fi

```

For several functions, we need to execute some code with `\selectfont`. With  $\TeX$  2021-06-01, there is a hook for this purpose.

```
3864 \def\bbl@patchfont#1{\AddToHook{selectfont}{#1}}
```

## 5.6. Basic bidi support

This code is currently placed here for practical reasons. It will be moved to the correct place soon, I hope.

It is loosely based on `rlbabel.def`, but most of it has been developed from scratch. This `babel` module (by Johannes Braams and Boris Lavva) has served the purpose of typesetting R documents for two decades, and despite its flaws I think it is still a good starting point (some parts have been copied here almost verbatim), partly thanks to its simplicity. I’ve also looked at `ARABI` (by Youssef Jabri), which is compatible with `babel`.

There are two ways of modifying macros to make them “bidi”, namely, by patching the internal low-level macros (which is what I have done with lists, columns, counters, tocs, much like `rlbabel` did), and by introducing a “middle layer” just below the user interface (sectioning, footnotes).

- `pdfTeX` provides a minimal support for bidi text, and it must be done by hand. Vertical typesetting is not possible.
- `xetex` is somewhat better, thanks to its font engine (even if not always reliable) and a few additional tools. However, very little is done at the paragraph level. Another challenging problem is text direction does not honour  $\TeX$  grouping.
- `luatex` can provide the most complete solution, as we can manipulate almost freely the node list, the generated lines, and so on, but bidi text does not work out of the box and some development is necessary. It also provides tools to properly set left-to-right and right-to-left page layouts. As `Lua $\TeX$ -ja` shows, vertical typesetting is possible, too.

```

## 5.7. Local Language Configuration

**\loadlocalcfg** At some sites it may be necessary to add site-specific actions to a language definition file. This can be done by creating a file with the same name as the language definition file, but with the extension .cfg. For instance the file norsk.cfg will be loaded when the language definition file norsk.ldf is loaded.

For plain-based formats we don't want to override the definition of \loadlocalcfg from plain.def.

```

4032 \bbl@trace{Local Language Configuration}
4033 \ifx\loadlocalcfg@undefined
4034   \ifpackagewith{babel}{noconfigs}%
4035   {\let\loadlocalcfg@gobble}%
4036   {\def\loadlocalcfg#1{%
4037     \InputIfFileExists{#1.cfg}%
4038     {\typeout{*****^}%
4039              * Local config file #1.cfg used^^}%
4040     *}}%
4041   \@empty}}
4042 \fi

```

## 5.8. Language options

Languages are loaded when processing the corresponding option *except* if a main language has been set. In such a case, it is not loaded until all options has been processed. The following macro inputs the ldf file and does some additional checks (\input works, too, but possible errors are not caught).

```

4043 \bbl@trace{Language options}
4044 \let\bbl@afterlang\relax
4045 \let\babelmodifiers\relax
4046 \let\bbl@loaded\@empty
4047 \def\bbl@load@language#1{%
4048   \InputIfFileExists{#1.ldf}%

4050     \ifx\bbl@loaded\@empty\else,\bbl@loaded\fi}%
4051     \expandafter\let\expandafter\bbl@afterlang
4052     \csname\CurrentOption.ldf-h@k\endcsname
4053     \expandafter\let\expandafter\babelmodifiers
4054     \csname bbl@mod@\CurrentOption\endcsname
4055     \bbl@exp{\AtBeginDocument{%
4056       \bbl@usehooks@lang{\CurrentOption}{begindocument}{\CurrentOption}}}%
4057   {\IfFileExists{babel-#1.tex}%
4058     {\def\bbl@tempa{%
4059       .\There is a locale ini file for this language.\%
4060       If it's the main language, try adding `provide=*'\%
4061       to the babel package options}}%
4062     {\let\bbl@tempa\empty}%
4063     \bbl@error{unknown-package-option}{}}}}

```

Now, we set a few language options whose names are different from ldf files. These declarations are preserved for backwards compatibility, but they must be eventually removed. Use proxy files instead.

```

4064 \def\bbl@try@load@lang#1#2#3{%
4065   \IfFileExists{\CurrentOption.ldf}%
4066     {\bbl@load@language{\CurrentOption}}%
4067     {#1\bbl@load@language{#2}#3}}
4068 %
4069 \DeclareOption{friulian}{\bbl@try@load@lang{}{friulan}{}}
4070 \DeclareOption{hebrew}{%
4071   \ifcase\bbl@engine\or
4072     \bbl@error{only-pdftex-lang}{hebrew}{luatex}{}%
4073   \fi
4074   \input{rlbabel.def}%
4075   \bbl@load@language{hebrew}}
4076 \DeclareOption{hungarian}{\bbl@try@load@lang{}{magyar}{}}
4077 \DeclareOption{lowersorbian}{\bbl@try@load@lang{}{lsorbian}{}}
4078 % \DeclareOption{nothernkurdish}{\bbl@try@load@lang{}{kurmanji}{}}
4079 \DeclareOption{polutonikogreek}{%
4080   \bbl@try@load@lang{}{greek}{\languageattribute{greek}{polutoniko}}}
4081 \DeclareOption{russian}{\bbl@try@load@lang{}{russianb}{}}
4082 \DeclareOption{ukrainian}{\bbl@try@load@lang{}{ukraineb}{}}
4083 \DeclareOption{uppersorbian}{\bbl@try@load@lang{}{usorbian}{}}
```

Another way to extend the list of ‘known’ options for babel was to create the file `bblopts.cfg` in which one can add option declarations. However, this mechanism is deprecated – if you want an alternative name for a language, just create a new ldf file loading the actual one. You can also set the name of the file with the package option `config=<name>`, which will load `<name>.cfg` instead.

```

4084 \ifx\bbl@opt@config\@nnil
4085   \ifpackagewith{babel}{noconfigs}{}%
4086     {\InputIfFileExists{bblopts.cfg}%
4087       {\typeout{*****^J%

4097 \fi
```

Recognizing global options in packages not having a closed set of them is not trivial, as for them to be processed they must be defined explicitly. So, package options not yet taken into account and stored in `bbl@language@opts` are assumed to be languages. If not declared above, the names of the option and the file are the same. We first pre-process the class and package options to determine the main language, which is processed in the third ‘main’ pass, *except* if all files are ldf *and* there is no main key. In the latter case (`\bbl@opt@main` is still `\@nnil`), the traditional way to set the main language is kept — the last loaded is the main language.

For efficiency, first preprocess the class options to remove those with `=`, which are becoming increasingly frequent (no language should contain this character).

```

4098 \def\bbl@tempf{,}
4099 \bbl@foreach\@raw@classoptionslist{%
4100   \in{=}{#1}%
4101   \ifin\else
4102     \edef\bbl@tempf{\bbl@tempf\zap@space#1 \@empty,}%
4103   \fi}
4104 \ifx\bbl@opt@main\@nnil
4105   \ifnum\bbl@iniflag>\z@ % if all ldf's: set implicitly, no main pass
4106     \let\bbl@tempb\@empty
4107     \edef\bbl@tempa{\bbl@tempf,\bbl@language@opts}%
4108     \bbl@foreach\bbl@tempa{\edef\bbl@tempb{#1,\bbl@tempb}}%
```

```

4109 \bbl@foreach\bbl@tempb{% \bbl@tempb is a reversed list
4110 \ifx\bbl@opt@main\@nnil % i.e., if not yet assigned
4111 \ifodd\bbl@iniflag % = *=
4112 \IfFileExists{babel-#1.tex}{\def\bbl@opt@main{#1}}{}%
4113 \else % n +=
4114 \IfFileExists{#1.ldf}{\def\bbl@opt@main{#1}}{}%
4115 \fi
4116 \fi}%
4117 \fi
4118 \else
4119 \bbl@info{Main language set with 'main='. Except if you have\\%
4120 problems, prefer the default mechanism for setting\\%
4121 the main language, i.e., as the last declared.\\%
4122 Reported}
4123 \fi

```

A few languages are still defined explicitly. They are stored in case they are needed in the ‘main’ pass (the value can be `\relax`).

```

4124 \ifx\bbl@opt@main\@nnil\else
4125 \bbl@ncarg\let\bbl@loadmain{ds@\bbl@opt@main}%
4126 \expandafter\let\csname ds@\bbl@opt@main\endcsname\relax
4127 \fi

```

Now define the corresponding loaders. With package options, assume the language exists. With class options, check if the option is a language by checking if the corresponding file exists.

```

4128 \bbl@foreach\bbl@language@opts{%
4129 \def\bbl@tempa{#1}%
4130 \ifx\bbl@tempa\bbl@opt@main\else
4131 \ifnum\bbl@iniflag<\tw@ % 0 0 (other = ldf)
4132 \bbl@ifunset{ds@#1}%
4133 {\DeclareOption{#1}{\bbl@load@language{#1}}}%
4134 {}%
4135 \else % + * (other = ini)
4136 \DeclareOption{#1}{%
4137 \bbl@ldfinit
4138 \babelprovide[@import]{#1}% %%%
4139 \bbl@afterldf{}}%
4140 \fi
4141 \fi}
4142 \bbl@foreach\bbl@tempf{%
4143 \def\bbl@tempa{#1}%
4144 \ifx\bbl@tempa\bbl@opt@main\else
4145 \ifnum\bbl@iniflag<\tw@ % 0 0 (other = ldf)
4146 \bbl@ifunset{ds@#1}%
4147 {\IfFileExists{#1.ldf}%

4155 \babelprovide[@import]{#1}% %%%
4156 \bbl@afterldf{}}}%
4157 {}%
4158 \fi
4159 \fi}

```

And we are done, because all options for this pass has been declared. Those already processed in the first pass are just ignored. There is still room for last minute changes with a `\TeX` hook (not a Babel one).

The options have to be processed in the order in which the user specified them (but remember class options are processed before):

```

4160 \NewHook{babel/presets}

```

```

4161 \UseHook{babel/presets}
4162 \def\AfterBabelLanguage#1{%
4163   \bbl@ifsamestring\CurrentOption{#1}{\global\bbl@add\bbl@afterlang}{}}
4164 \DeclareOption*{}
4165 \ProcessOptions*

```

This finished the second pass. Now the third one begins, which loads the main language set with the key main. A warning is raised if the main language is not the same as the last named one, or if the value of the key main is not a language. With some options in provide, the package luatexbase is loaded (and immediately used), and therefore \babelprovide can't go inside a \DeclareOption; this explains why it's executed directly, with a dummy declaration. Then all languages have been loaded, so we deactivate \AfterBabelLanguage.

```

## 6. The kernel of Babel

The kernel of the babel system is currently stored in `babel.def`. The file `babel.def` contains most of the code. The file `hyphen.cfg` is a file that can be loaded into the format, which is necessary when you want to be able to switch hyphenation patterns.

Because plain  $\TeX$  users might want to use some of the features of the babel system too, care has to be taken that plain  $\TeX$  can process the files. For this reason the current format will have to be checked in a number of places. Some of the code below is common to plain  $\TeX$  and  $\LaTeX$ , some of it is for the  $\LaTeX$  case only.

Plain formats based on `etex` (`etex`, `xetex`, `luatex`) don't load `hyphen.cfg` but `etex.src`, which follows a different naming convention, so we need to define the babel names. It presumes `language.def` exists and it is the same file used when formats were created.

A proxy file for `switch.def`

```

4219 <*kernel>
4220 \let\bbl@onlyswitch\@empty
4221 \input babel.def
4222 \let\bbl@onlyswitch\@undefined
4223 </kernel>

```

## 7. Error messages

They are loaded when `\bbl@error` is first called. To save space, the main code just identifies them with a tag, and messages are stored in a separate file. Since it can be loaded anywhere, you make sure some catcodes have the right value, although those for `\`, ```, `^`, `M`, `%` and `=` are reset before loading the file.

```

4224 <*errors>
4225 \catcode`\{=1 \catcode`\}=2 \catcode`\#=6
4226 \catcode`\:=12 \catcode`\,=12 \catcode`\.=12 \catcode`\-=12

## 8. Loading hyphenation patterns

The following code is meant to be read by `iniTeX` because it should instruct `TeX` to read hyphenation patterns. To this end the `docstrip` option `patterns` is used to include this code in the file `hyphen.cfg`. Code is written with lower level macros.

```

4417 <@Make sure ProvidesFile is defined@>
4418 \ProvidesFile{hyphen.cfg}[<@date@> v<@version@> Babel hyphens]
4419 \xdef\bbl@format{\jobname}
4420 \def\bbl@version{<@version@>}
4421 \def\bbl@date{<@date@>}
4422 \ifx\AtBeginDocument\undefined
4423 \def\@empty{}
4424 \fi
4425 <@Define core switching macros@>

```

**\process@line** Each line in the file `language.dat` is processed by `\process@line` after it is read. The first thing this macro does is to check whether the line starts with `=`. When the first token of a line is an `=`, the macro `\process@synonym` is called; otherwise the macro `\process@language` will continue.

```

4426 \def\process@line#1#2 #3 #4 {%
4427 \ifx=#1%
4428 \process@synonym{#2}%
4429 \else
4430 \process@language{#1#2}{#3}{#4}%
4431 \fi

```

4432 \ignorespaces}

**\process@synonym** This macro takes care of the lines which start with an =. It needs an empty token register to begin with. \bbl@languages is also set to empty.

```
4433 \toks@{}
4434 \def\bbl@languages{}
```

When no languages have been loaded yet, the name following the = will be a synonym for hyphenation register 0. So, it is stored in a token register and executed when the first pattern file has been processed. (The \relax just helps to the \if below catching synonyms without a language.)

Otherwise the name will be a synonym for the language loaded last.

We also need to copy the hyphenmin parameters for the synonym.

```
4435 \def\process@synonym#1{%
4436   \ifnum\last@language=\m@ne
4437     \toks@\expandafter{\the\toks@\relax\process@synonym{#1}}%
4438   \else
4439     \expandafter\chardef\csname l@#1\endcsname\last@language
4440     \wlog{\string\l@#1=\string\language\the\last@language}%
4441     \expandafter\let\csname #1hyphenmins\expandafter\endcsname
4442       \csname\language\hyphenmins\endcsname
4443     \let\bbl@elt\relax
4444     \edef\bbl@languages{\bbl@languages\bbl@elt{#1}{\the\last@language}}}%
4445   \fi}
```

**\process@language** The macro \process@language is used to process a non-empty line from the ‘configuration file’. It has three arguments, each delimited by white space. The first argument is the ‘name’ of a language; the second is the name of the file that contains the patterns. The optional third argument is the name of a file containing hyphenation exceptions.

The first thing to do is call \addlanguage to allocate a pattern register and to make that register ‘active’. Then the pattern file is read.

For some hyphenation patterns it is needed to load them with a specific font encoding selected. This can be specified in the file language.dat by adding for instance ‘:T1’ to the name of the language. The macro \bbl@get@enc extracts the font encoding from the language name and stores it in \bbl@hyph@enc. The latter can be used in hyphenation files if you need to set a behavior depending on the given encoding (it is set to empty if no encoding is given).

Pattern files may contain assignments to \lefthyphenmin and \righthyphenmin. T<sub>E</sub>X does not keep track of these assignments. Therefore we try to detect such assignments and store them in the \<language>hyphenmins macro. When no assignments were made we provide a default setting.

Some pattern files contain changes to the \lccode en \uccode arrays. Such changes should remain local to the language; therefore we process the pattern file in a group; the \patterns command acts globally so its effect will be remembered.

Then we globally store the settings of \lefthyphenmin and \righthyphenmin and close the group.

When the hyphenation patterns have been processed we need to see if a file with hyphenation exceptions needs to be read. This is the case when the third argument is not empty and when it does not contain a space token. (Note however there is no need to save hyphenation exceptions into the format.)

\bbl@languages saves a snapshot of the loaded languages in the form \bbl@elt{<language-name>}{<number>}{<patterns-file>}{<exceptions-file>}. Note the last 2 arguments are empty in ‘dialects’ defined in language.dat with =. Note also the language name can have encoding info.

Finally, if the counter \language is equal to zero we execute the synonyms stored.

```

Now the macros defining the font with `fontspec`.

When there are repeated keys in `fontspec`, the last value wins. So, we just place the ini settings at the beginning, and user settings will take precedence. We must deactivate temporarily `\bbl@mapselect` because `\selectfont` is called internally when a font is defined.

For historical reasons,  $\text{\LaTeX}$  can select two different series (bx and b), for what is conceptually a single one. This can lead to problems when a single family requires several fonts, depending on the language, mainly because ‘substitutions’ with some combinations are not done consistently – sometimes bx/sc is the correct font, but sometimes points to b/n, even if b/sc exists. So, some substitutions are redefined (in a somewhat hackish way, by inspecting if the variant declaration contains >ssub\*).

```

## 10. Hooks for XeTeX and LuaTeX

### 10.1. XeTeX

Unfortunately, the current encoding cannot be retrieved and therefore it is reset always to utf8, which seems a sensible default.

Now, the code.

```

## 10.2. Support for interchar

xetex reserves some values for CJK (although they are not set in XELATEX), so we make sure they are skipped. Define some user names for the global classes, too.

```
4876 \ifnum\xe@alloc@intercharclass<\thr@@
4877 \xe@alloc@intercharclass\thr@@
4878 \fi
4879 \chardef\bbl@xe@class@default=\z@
4880 \chardef\bbl@xe@class@cjkideogram=\@ne
4881 \chardef\bbl@xe@class@cjkleftpunctuation=\tw@
4882 \chardef\bbl@xe@class@cjkrightpunctuation=\thr@@
4883 \chardef\bbl@xe@class@boundary=4095
4884 \chardef\bbl@xe@class@ignore=4096
```

The machinery is activated with a hook (enabled only if actually used). Here \bbl@tempc is pre-set with \bbl@usingxe@class, defined below. The standard mechanism based on \originalTeX to save, set and restore values is used. \count@ stores the previous char to be set, except at the beginning (0) and after \bbl@upto, which is the previous char negated, as a flag to mark a range.

```
4885 \AddBabelHook{babel-interchar}{beforeextras}{%
4886 \nameuse{bbl@xechars@\language@}}
4887 \DisableBabelHook{babel-interchar}
4888 \protected\def\bbl@charclass#1{%
4889 \ifnum\count@<\z@
4890 \count@-\count@
4891 \loop
4892 \bbl@exp{%
4893 \\\babel@savevariable{\XeTeXcharclass`\Uchar\count@}}%
4894 \XeTeXcharclass\count@ \bbl@tempc
4895 \ifnum\count@<`#1\relax
4896 \advance\count@\@ne
4897 \repeat
4898 \else

4900 \XeTeXcharclass`#1 \bbl@tempc
4901 \fi
4902 \count@`#1\relax}
```

Now the two user macros. Char classes are declared implicitly, and then the macro to be executed at the babel-interchar hook is created. The list of chars to be handled by the hook defined above has internally the form \bbl@usingxe@class\bbl@xe@class@punct@english\bbl@charclass{.} \bbl@charclass{,} (etc.), where \bbl@usingxe@class stores the class to be applied to the subsequent characters. The \ifcat part deals with the alternative way to enter characters as macros (e.g., \}). As a special case, hyphens are stored as \bbl@upto, to deal with ranges.

```

### 10.3. Layout

Note elements like headlines and margins can be modified easily with packages like fancyhdr, typearea or titles, and geometry.

`\bbl@startskip` and `\bbl@endskip` are available to package authors. Thanks to the  $\TeX$  expansion mechanism the following constructs are valid: `\adim\bbl@startskip`, `\advance\bbl@startskip\adim`, `\bbl@startskip\adim`.

Consider `txtbabel` as a shorthand for *tex-xet babel*, which is the bidi model in both `pdftex` and `xetex`.

```

## 10.5. LuaTeX

The loader for luatex is based solely on `language.dat`, which is read on the fly. The code shouldn't be executed when the format is build, so we check if `\AddBabelHook` is defined. Then comes a modified version of the loader in `hyphen.cfg` (without the `hyphenmins` stuff, which is under the direct control of `babel`).

The names `\l@<language>` are defined and take some value from the beginning because all `ldf` files assume this for the corresponding language to be considered valid, but patterns are not loaded (except the first one). This is done later, when the language is first selected (which usually means when the `ldf` finishes). If a language has been loaded, `\bbl@hyphendata@<num>` exists (with the names of the files read).

The default setup preloads the first language into the format. This is intended mainly for 'english', so that it's available without further intervention from the user. To avoid duplicating it, the following rule applies: if the "0th" language and the first language in `language.dat` have the same name then just ignore the latter. If there are new synonymous, they are added, but note if the language patterns have not been preloaded they won't at run time.

Other preloaded languages could be read twice, if they have been preloaded into the format. This is not optimal, but it shouldn't happen very often – with luatex patterns are best loaded when the document is typeset, and the "0th" language is preloaded just for backwards compatibility.

As of 1.1b, `lua(e)tex` is taken into account. Formerly, loading of patterns on the fly didn't work in this format, but with the new loader it does. Unfortunately, the format is not based on `babel`, and data could be duplicated, because languages are reassigned above those in the format (nothing serious, anyway). Note even with this format `language.dat` is used (under the principle of a single source), instead of `language.def`.

Of course, there is room for improvements, like tools to read and reassign languages, which would require modifying the language list, and better error handling.

We need catcode tables, but no format (targeted by `babel`) provide a command to allocate them (although there are packages like `ctablestack`). FIX - This isn't true anymore. For the moment, a dangerous approach is used - just allocate a high random number and cross the fingers. To complicate things, `etex.sty` changes the way languages are allocated.

This files is read at three places: (1) when `plain.def`, `babel.sty` starts, to read the list of available languages from `language.dat` (for the base option); (2) at `hyphen.cfg`, to modify some macros; (3) in the middle of `plain.def` and `babel.sty`, by `babel.def`, with the commands and other definitions for luatex (e.g., `\babelpatterns`).

```

## 10.6. Southeast Asian scripts

First, some general code for line breaking, used by `\babelposthyphenation`.

Replace regular (i.e., implicit) discretionaries by spaceskips, based on the previous glyph (which I think makes sense, because the hyphen and the previous char go always together). Other discretionaries are not touched. See Unicode UAX 14.

## 10.7. CJK line breaking

Minimal line breaking for CJK scripts, mainly intended for simple documents and short texts as a secondary language. Only line breaking, with a little stretching for justification, without any attempt to adjust the spacing. It is based on (but does not strictly follow) the Unicode algorithm.

We first need a little table with the corresponding line breaking properties. A few characters have an additional key for the width (fullwidth vs. halfwidth), not yet used. There is a separate file, defined below.

```

## 10.9. Common stuff

First, a couple of auxiliary macros to set the renderer according to the script. This is done by patching temporarily the low-level fontspec macro containing the current features set with `\defaultfontfeatures`. Admittedly this is somewhat dangerous, but that way the latter command still works as expected, because the renderer is set just before other settings. In xetex they are set to `\relax`.

```

5945 <@Font selection@>

```

## 10.10. Automatic fonts and ids switching

After defining the blocks for a number of scripts (must be extended and very likely fine tuned), we define a the function `Babel.locale_map`, which just traverse the node list to carry out the replacements. The table `loc_to_scr` stores the script range for each locale (whose id is the key), copied from this table (so that it can be modified on a locale basis); there is an intermediate table named `chr_to_loc` built on the fly for optimization, which maps a char to the locale. This locale is then used to get the `\language` as stored in `locale_props`, as well as the font (as requested). In the

latter table a key starting with / maps the font from the global one (the key) to the local one (the value). Maths are skipped and discretionaries are handled in a special way.

```

Post-handling hyphenation patterns for non-standard rules, like `ff` to `ff-f`. There are still some issues with speed (not very slow, but still slow). The Lua code is below.

```

6115 \directlua{% DL7
6116   Babel.nohyphenation = \the\l@nohyphenation
6117 }

```

Now the  $\TeX$  high level interface, which requires the function defined above for converting strings to functions returning a string. These functions handle the `{n}` syntax. For example, `pre={1}{1}` becomes `function(m) return m[1]..m[1]..'-' end`, where `m` are the matches returned after applying the pattern. With a mapped capture the functions are similar to `function(m) return Babel.capt_map(m[1],1) end`, where the last argument identifies the mapping to be applied to `m[1]`. The way it is carried out is somewhat tricky, but the effect is not dissimilar to `lua load` – save the code as string in a  $\TeX$  macro, and expand this macro at the appropriate place. As `\directlua` does not take into account the current catcode of `@`, we just avoid this character in macro names (which explains the internal group, too).

```

The following experimental (and unfinished) macro applies the prehyphenation transforms for the current locale to a string (characters and spaces) and processes it in a fully expandable way (among other limitations, the string can't contain `]==]`). The way it operates is admittedly rather cumbersome: it converts the string to a node list, processes it, and converts it back to a string. The lua code is in the lua file below.

```

6316 \newcommand\localeprehyphenation[1]{%
6317 \directlua{ Babel.string_prehyphenation([==[#1]==], \the\localeid) }}

```

## 10.11.Bidi

As a first step, add a handler for bidi and digits (and potentially other processes) just before `luaotfload` is applied, which is loaded by default by  $\TeX$ . Just in case, consider the possibility it has not been loaded.

```

6318 \def\bbl@activate@preotf{%
6319 \let\bbl@activate@preotf\relax % only once
6320 \directlua{
6321     function Babel.pre_otfload_v(head)
6322         if Babel.numbers and Babel.digits_mapped then
6323             head = Babel.numbers(head)
6324         end
6325         if Babel.bidi_enabled then
6326             head = Babel.bidi(head, false, dir)
6327         end
6328         return head
6329     end
6330     %
6331     function Babel.pre_otfload_h(head, gc, sz, pt, dir) %%% TODO
6332         if Babel.numbers and Babel.digits_mapped then
6333             head = Babel.numbers(head)
6334         end
6335         if Babel.bidi_enabled then
6336             head = Babel.bidi(head, false, dir)
6337         end
6338         return head
6339     end
6340     %
6341     luatexbase.add_to_callback('pre_linebreak_filter',
6342         Babel.pre_otfload_v,
6343         'Babel.pre_otfload_v',
6344         luatexbase.priority_in_callback('pre_linebreak_filter',
6345             'luaotfload.node_processor') or nil)
6346     %
6347     luatexbase.add_to_callback('hpack_filter',
6348         Babel.pre_otfload_h,
6349         'Babel.pre_otfload_h',
6350         luatexbase.priority_in_callback('hpack_filter',
6351             'luaotfload.node_processor') or nil)
6352 }}

```

The basic setup. The output is modified at a very low level to set the `\bodydir` to the `\pagedir`. Sadly, we have to deal with boxes in math with basic, so the `\bbl@mathboxdir` hack is activated every math with the package option `bidi=`. The hack for the PUA is no longer necessary with basic (24.8), but it's kept in `basic-r`.

## 10.12 Layout

Unlike xetex, luatex requires only minimal changes for right-to-left layouts, particularly in monolingual documents (the engine itself reverses boxes – including column order or headings –, margins, etc.) with `bidi=basic`, without having to patch almost any macro where text direction is relevant.

Still, there are three areas deserving special attention, namely, tabular, math, and graphics, text and intrinsically left-to-right elements are intermingled. I’ve made some progress in graphics, but they’re essentially hacks; I’ve also made some progress in ‘tabular’, but when I decided to tackle math (both standard math and ‘amsmath’) the nightmare began. I’m still not sure how ‘amsmath’ should be modified, but the main problem is that, boxes are “generic” containers that can hold text, math, and graphics (even at the same time; remember that inline math is included in the list of text nodes marked with ‘math’ (11) nodes too).

`\@hangfrom` is useful in many contexts and it is redefined always with the layout option.

There are, however, a number of issues when the text direction is not the same as the box direction (as set by `\bodydir`), and when `\parbox` and `\hangindent` are involved. Fortunately, latest releases of luatex simplify a lot the solution with `\shapemode`.

With the issue #15 I realized commands are best patched, instead of redefined. With a few lines, a modification could be applied to several classes and packages. Now, `tabular` seems to work (at least in simple cases) with `array`, `tabularx`, `hhline`, `colortbl`, `longtable`, `booktabs`, etc. However, `dcolumn` still fails.

```

OMEGA provided a companion to `\mathdir` (`\nextfakemath`) for those cases where we did not want it to be applied, so that the writing direction of the main text was left unchanged. `\bbl@nextfake` is an attempt to emulate it, because `luatex` has removed it without an alternative. Also, `\hangindent` does not honour direction changes by default, so we need to redefine `\@hangfrom`.

## 10.13 Lua: transforms

After declaring the table containing the patterns with their replacements, we define some auxiliary functions: `str_to_nodes` converts the string returned by a function to a node list, taking the node at base as a model (font, language, etc.); `fetch_word` fetches a series of glyphs and discretionary, which pattern is matched against (if there is a match, it is called again before trying other patterns, and this is very likely the main bottleneck).

`post_hyphenate_replace` is the callback applied after `lang.hyphenate`. This means the automatic hyphenation points are known. As empty captures return a byte position (as explained in the `luatex` manual), we must convert it to a utf8 position. With `first`, the last byte can be the leading byte in a utf8 sequence, so we just remove it and add 1 to the resulting length. With `last` we must take into account the capture position points to the next character. Here `word_head` points to the starting node of the text to be matched.

```

## 10.14 Lua: Auto bidi with basic and basic-r

The file `babel-data-bidi.lua` currently only contains data. It is a large and boring file and it is not shown here (see the generated file), but here is a sample:

```

% [0x25]={d='et'},
% [0x26]={d='on'},
% [0x27]={d='on'},
% [0x28]={d='on', m=0x29},
% [0x29]={d='on', m=0x28},
% [0x2A]={d='on'},
% [0x2B]={d='es'},
% [0x2C]={d='cs'},
%

```

For the meaning of these codes, see the Unicode standard.

Now the `basic-r` bidi mode. One of the aims is to implement a fast and simple bidi algorithm, with a single loop. I managed to do it for R texts, with a second smaller loop for a special case. The code is still somewhat chaotic, but its behavior is essentially correct. I cannot resist copying the following text from Emacs `bidi.c` (which also attempts to implement the bidi algorithm with a single loop):

Arrrrgh!! The UAX#9 algorithm is too deeply entrenched in the assumption of batch-style processing [...]. May the fleas of a thousand camels infest the armpits of those who design supposedly general-purpose algorithms by looking at their own implementations, and fail to consider other possible implementations!

Well, it took me some time to guess what the batch rules in UAX#9 actually mean (in other word, *what* they do and *why*, and not only *how*), but I think (or I hope) I've managed to understand them.

In some sense, there are two bidi modes, one for numbers, and the other for text. Furthermore, setting just the direction in R text is not enough, because there are actually *two* R modes (set explicitly in Unicode with RLM and ALM). In babel the dir is set by a higher protocol based on the language/script, which in turn sets the correct dir (<l>, <r> or <al>).

From UAX#9: "Where available, markup should be used instead of the explicit formatting characters". So, this simple version just ignores formatting characters. Actually, most of that annex is devoted to how to handle them.

BD14-BD16 are not implemented. Unicode (and the W3C) are making a great effort to deal with some special problematic cases in "streamed" plain text. I don't think this is the way to go – particular issues should be fixed by a high level interface taking into account the needs of the document. And here is where luatex excels, because everything related to bidi writing is under our control.

7661       end
7662     end
7663     dir = dir or 'l'
7664     if inmath then dir = ('TRT' == tex.mathdir) and 'r' or 'l' end

```

Next is based on the assumption babel sets the language *and* switches the script with its dir. We treat a language block as a separate Unicode sequence. The following piece of code is executed at the first glyph after a 'dir' node. We don't know the current language until then. This is not exactly true, as the math mode may insert explicit dirs in the node list, so, for the moment there is a hack by brute force (just above).

```

7665   if new_dir then
7666     attr_dir = 0
7667     for at in node.traverse(item.attr) do
7668       if at.number == Babel.attr_dir then
7669         attr_dir = at.value & 0x3
7670       end
7671     end
7672     if attr_dir == 1 then
7673       strong = 'r'
7674     elseif attr_dir == 2 then
7675       strong = 'al'
7676     else
7677       strong = 'l'
7678     end
7679     strong_lr = (strong == 'l') and 'l' or 'r'
7680     outer = strong_lr
7681     new_dir = false
7682   end
7683
7684   if dir == 'nsm' then dir = strong end -- W1

```

**Numbers.** The dual <al>/<r> system for R is somewhat cumbersome.

```

7685   dir_real = dir -- We need dir_real to set strong below
7686   if dir == 'al' then dir = 'r' end -- W3

```

By W2, there are no <en> <et> <es> if strong == <al>, only <an>. Therefore, there are not <et en> nor <en et>, W5 can be ignored, and W6 applied:

```

7687   if strong == 'al' then
7688     if dir == 'en' then dir = 'an' end -- W2
7689     if dir == 'et' or dir == 'es' then dir = 'on' end -- W6
7690     strong_lr = 'r' -- W3

```

```
7691     end
```

Once finished the basic setup for glyphs, consider the two other cases: dir node and the rest.

```
7692     elseif item.id == node.id'dir' and not inmath then
7693         new_dir = true
7694         dir = nil
7695     elseif item.id == node.id'math' then
7696         inmath = (item.subtype == 0)
7697     else
7698         dir = nil          -- Not a char
7699     end
```

Numbers in R mode. A sequence of <en>, <et>, <an>, <es> and <cs> is typeset (with some rules) in L mode. We store the starting and ending points, and only when anything different is found (including nil, i.e., a non-char), the textdir is set. This means you cannot insert, say, a whatsit, but this is what I would expect (with luacolor you may colorize some digits). Anyway, this behavior could be changed with a switch in the future. Note in the first branch only <an> is relevant if <al>.

```
7700     if dir == 'en' or dir == 'an' or dir == 'et' then
7701         if dir ~= 'et' then
7702             type_n = dir
7703         end
7704         first_n = first_n or item
7705         last_n = last_es or item
7706         last_es = nil
7707     elseif dir == 'es' and last_n then -- W3+W6
7708         last_es = item
7709     elseif dir == 'cs' then          -- it's right - do nothing
7710     elseif first_n then -- & if dir = any but en, et, an, es, inc nil
7711         if strong_lr == 'r' and type_n ~= '' then
7712             dir_mark(head, first_n, last_n, 'r')
7713         elseif strong_lr == 'l' and first_d and type_n == 'an' then
7714             dir_mark(head, first_n, last_n, 'r')
7715             dir_mark(head, first_d, last_d, outer)
7716             first_d, last_d = nil, nil
7717         elseif strong_lr == 'l' and type_n ~= '' then
7718             last_d = last_n
7719         end
7720         type_n = ''
7721         first_n, last_n = nil, nil
7722     end
```

R text in L, or L text in R. Order of dir\_ mark's are relevant: d goes outside n, and therefore it's emitted after. See dir\_mark to understand why (but is the nesting actually necessary or is a flat dir structure enough?). Only L, R (and AL) chars are taken into account – everything else, including spaces, whatsits, etc., are ignored:

```
7723     if dir == 'l' or dir == 'r' then
7724         if dir ~= outer then
7725             first_d = first_d or item
7726             last_d = item
7727         elseif first_d and dir ~= strong_lr then
7728             dir_mark(head, first_d, last_d, outer)
7729             first_d, last_d = nil, nil
7730         end
7731     end
```

**Mirroring.** Each chunk of text in a certain language is considered a “closed” sequence. If <r on r> and <l on l>, it's clearly <r> and <l>, resptly, but with other combinations depends on outer. From all these, we select only those resolving <on> → <r>. At the beginning (when last\_lr is nil) of an R text, they are mirrored directly. Numbers in R mode are processed. It should not be done, but it doesn't hurt.

```
7732     if dir and not last_lr and dir ~= 'l' and outer == 'r' then
7733         item.char = characters[item.char] and
7734             characters[item.char].m or item.char
7735     elseif (dir or new_dir) and last_lr ~= item then
```

```

7736     local mir = outer .. strong_lr .. (dir or outer)
7737     if mir == 'rrr' or mir == 'lrr' or mir == 'rrl' or mir == 'rlr' then
7738         for ch in node.traverse(node.next(last_lr)) do
7739             if ch == item then break end
7740             if ch.id == node.id'glyph' and characters[ch.char] then
7741                 ch.char = characters[ch.char].m or ch.char
7742             end
7743         end
7744     end
7745 end

```

Save some values for the next iteration. If the current node is 'dir', open a new sequence. Since dir could be changed, strong is set with its real value (dir\_real).

```

7746     if dir == 'l' or dir == 'r' then
7747         last_lr = item
7748         strong = dir_real          -- Don't search back - best save now
7749         strong_lr = (strong == 'l') and 'l' or 'r'
7750     elseif new_dir then
7751         last_lr = nil
7752     end
7753 end

```

Mirror the last chars if they are no directed. And make sure any open block is closed, too.

```

7754 if last_lr and outer == 'r' then
7755     for ch in node.traverse_id(node.id'glyph', node.next(last_lr)) do
7756         if characters[ch.char] then
7757             ch.char = characters[ch.char].m or ch.char
7758         end
7759     end
7760 end
7761 if first_n then
7762     dir_mark(head, first_n, last_n, outer)
7763 end
7764 if first_d then
7765     dir_mark(head, first_d, last_d, outer)
7766 end

```

In boxes, the dir node could be added before the original head, so the actual head is the previous node.

```

7767 return node.prev(head) or head
7768 end
7769 </basic-r>

```

And here the Lua code for bidi=basic:

## 11. Data for CJK

It is a boring file and it is not shown here (see the generated file), but here is a sample:

```
% [0x0021]={c='ex'},
% [0x0024]={c='pr'},
% [0x0025]={c='po'},
% [0x0028]={c='op'},
% [0x0029]={c='cp'},
% [0x002B]={c='pr'},
%
```

For the meaning of these codes, see the Unicode standard.

## 12. The ‘nil’ language

This ‘language’ does nothing, except setting the hyphenation patterns to nohyphenation. For this language currently no special definitions are needed or available.

The macro `\LdfInit` takes care of preventing that this file is loaded more than once, checking the category code of the `@` sign, etc.

```
8224 <{*nil}
8225 \ProvidesLanguage{nil}[<@date@> v<@version@> Nil language]
8226 \LdfInit{nil}{datenil}
```

When this file is read as an option, i.e., by the `\usepackage` command, `nil` could be an ‘unknown’ language in which case we have to make it known.

```
8227 \ifx\l@nil\undefined
8228 \newlanguage\l@nil
8229 \@namedef{bbl@hyphendata@the\l@nil}{}{}{}% Remove warning
8230 \let\bbl@elt\relax
8231 \edef\bbl@languages{% Add it to the list of languages
8232 \bbl@languages\bbl@elt{nil}{the\l@nil}{}{}}
8233 \fi
```

This macro is used to store the values of the hyphenation parameters `\lefthyphenmin` and `\righthyphenmin`.

```
8234 \providehyphenmins{\CurrentOption}{\m@ne\m@ne}
```

The next step consists of defining commands to switch to (and from) the ‘nil’ language.

**`\captionnil`**  
**`\datenil`**

```
8235 \let\captionnil\empty
8236 \let\datenil\empty
```

There is no locale file for this pseudo-language, so the corresponding fields are defined here.

```
8237 \def\bbl@inidata@nil{%
8238 \bbl@elt{identification}{tag.ini}{und}%
8239 \bbl@elt{identification}{load.level}{0}%
8240 \bbl@elt{identification}{charset}{utf8}%
8241 \bbl@elt{identification}{version}{1.0}%
8242 \bbl@elt{identification}{date}{2022-05-16}%
8243 \bbl@elt{identification}{name.local}{nil}%
8244 \bbl@elt{identification}{name.english}{nil}%
8245 \bbl@elt{identification}{name.babel}{nil}%
8246 \bbl@elt{identification}{tag.bcp47}{und}%
8247 \bbl@elt{identification}{language.tag.bcp47}{und}%

8262 \@namedef{bbl@sname@nil}{Latin}
8263 \@namedef{bbl@sbc@nil}{Latn}
8264 \@namedef{bbl@sotf@nil}{latn}

```

The macro `\ldf@finish` takes care of looking for a configuration file, setting the main language to be switched on at `\begin{document}` and resetting the category code of `@` to its original value.

```

8265 \ldf@finish{nil}
8266 </nil>

```

## 13. Calendars

The code for specific calendars are placed in the specific files, loaded when requested by an ini file in the identification section with `require.calendars`.

Start with function to compute the Julian day. It's based on the little library `calendar.js`, by John Walker, in the public domain.

```

8267 <<*Compute Julian day>> ≡
8268 \def\bbl@fpmo#1#2{(#1-#2*floor(#1/#2))}
8269 \def\bbl@cs@gregleap#1{%
8270   (\bbl@fpmo{#1}{4} == 0) &&
8271   (!((\bbl@fpmo{#1}{100} == 0) && (\bbl@fpmo{#1}{400} != 0)))}
8272 \def\bbl@cs@jd#1#2#3{% year, month, day
8273   \fp_eval:n{ 1721424.5 + (365 * (#1 - 1)) +
8274     floor((#1 - 1) / 4) + (-floor((#1 - 1) / 100)) +
8275     floor((#1 - 1) / 400) + floor(((367 * #2) - 362) / 12) +
8276     ((#2 <= 2) ? 0 : (\bbl@cs@gregleap{#1} ? -1 : -2)) + #3 } }
8277 <</Compute Julian day>>

```

### 13.1. Islamic

The code for the Civil calendar is based on it, too.

```

8278 <*ca-islamic>
8279 \ExplSyntaxOn
8280 <@Compute Julian day@>
8281 % == islamic (default)
8282 % Not yet implemented
8283 \def\bbl@ca@islamic#1-#2-#3\@#4#5#6{

```

The Civil calendar.

```

8284 \def\bbl@cs@isltojd#1#2#3{ % year, month, day

## 13.2. Hebrew

This is basically the set of macros written by Michail Rozman in 1991, with corrections and adaptations by Rama Porrat, Misha, Dan Haran and Boris Lavva. This must be eventually replaced by computations with l3fp. An explanation of what's going on can be found in `hebcsl.sty`

### 13.3. Persian

There is an algorithm written in TeX by Jabri, Abolhassani, Pournader and Esfahbod, created for the first versions of the FarsiTeX system (no longer available), but the original license is GPL, so its use with LPL is problematic. The code here follows loosely that by John Walker, which is free and accurate, but sadly very complex, so the relevant data for the years 2013-2050 have been pre-calculated and stored. Actually, all we need is the first day (either March 20 or March 21).

```

## 14. Support for Plain T<sub>E</sub>X (plain.def)

### 14.1. Not renaming hyphen.tex

As Don Knuth has declared that the filename `hyphen.tex` may only be used to designate *his* version of the american English hyphenation patterns, a new solution has to be found in order to be able to load hyphenation patterns for other languages in a plain-based T<sub>E</sub>X-format. When asked he responded:

That file name is “sacred”, and if anybody changes it they will cause severe upward/downward compatibility headaches.

People can have a file `locallyhyphen.tex` or whatever they like, but they mustn’t diddle with `hyphen.tex` (or `plain.tex` except to preload additional fonts).

The files `bplain.tex` and `blplain.tex` can be used as replacement wrappers around `plain.tex` and `lplain.tex` to achieve the desired effect, based on the `babel` package. If you load each of them with `iniTEX`, you will get a file called either `bplain.fmt` or `blplain.fmt`, which you can use as replacements for `plain.fmt` and `lplain.fmt`.

As these files are going to be read as the first thing `iniTEX` sees, we need to set some category codes just to be able to change the definition of `\input`.

```

8749 <{*bplain | blplain}
8750 \catcode`\{=1 % left brace is begin-group character
8751 \catcode`\}=2 % right brace is end-group character
8752 \catcode`\#=6 % hash mark is macro parameter character

```

If a file called `hyphen.cfg` can be found, we make sure that *it* will be read instead of the file `hyphen.tex`. We do this by first saving the original meaning of `\input` (and I use a one letter control sequence for that so as not to waste multi-letter control sequence on this in the format).

```

8753 \openin 0 hyphen.cfg
8754 \ifeof0
8755 \else
8756   \let\input

```

Then `\input` is defined to forget about its argument and load `hyphen.cfg` instead. Once that's done the original meaning of `\input` can be restored and the definition of `\a` can be forgotten.

```

8757   \def\input #1 {%
8758     \let\input\a
8759     \a hyphen.cfg
8760     \let\a\undefined
8761   }
8762 \fi
8763 </bplain | bplain>

```

Now that we have made sure that `hyphen.cfg` will be loaded at the right moment it is time to load `plain.tex`.

```

8764 <bplain>\a plain.tex
8765 <bplain>\a lplain.tex

```

Finally we change the contents of `\fmtname` to indicate that this is *not* the plain format, but a format based on plain with the `babel` package preloaded.

```

8766 <bplain>\def\fmtname{babel-plain}
8767 <bplain>\def\fmtname{babel-lplain}

```

When you are using a different format, based on `plain.tex` you can make a copy of `blplain.tex`, rename it and replace `plain.tex` with the name of your format file.

## 14.2. Emulating some $\text{\LaTeX}$ features

The file `babel.def` expects some definitions made in the  $\text{\LaTeX} 2_{\epsilon}$  style file. So, in Plain we must provide at least some predefined values as well some tools to set them (even if not all options are available). There are no package options, and therefore an alternative mechanism is provided. For the moment, only `\babeloptionstrings` and `\babeloptionmath` are provided, which can be defined before loading `babel`. `\BabelModifiers` can be set too (but not sure it works).

```

8939 \bbl@tempa

```

$\TeX$  has a macro to check whether a certain package was loaded with specific options. The command has two extra arguments which are code to be executed in either the true or false case. This is used to detect whether the document needs one of the accents to be activated (`activegrave` and `activeacute`). For plain  $\TeX$  we assume that the user wants them to be active by default. Therefore the only thing we do is execute the third argument (the code for the true case).

```

8940 \def\@ifpackagewith#1#2#3#4{#3}

```

The  $\TeX$  macro `\@ifl@aded` checks whether a file was loaded. This functionality is not needed for plain  $\TeX$  but we need the macro to be defined as a no-op.

```

8941 \def\@ifl@aded#1#2#3#4{}

```

For the following code we need to make sure that the commands `\newcommand` and `\providecommand` exist with some sensible definition. They are not fully equivalent to their  $\TeX 2_{\epsilon}$  versions; just enough to make things work in plain  $\TeX$  environments.

```

8942 \ifx\@tempcnta\@undefined
8943   \csname newcount\endcsname\@tempcnta\relax
8944 \fi
8945 \ifx\@tempcntb\@undefined
8946   \csname newcount\endcsname\@tempcntb\relax
8947 \fi

```

To prevent wasting two counters in  $\TeX$  (because counters with the same name are allocated later by it) we reset the counter that holds the next free counter (`\count10`).

```

```

Currently we only use the  $\text{\LaTeX 2}\epsilon$  method for accents for those that are known to be made active in *some* language definition file.

```

9100 \DeclareTextAccent{"}{OT1}{127}
9101 \DeclareTextAccent{'}{OT1}{19}
9102 \DeclareTextAccent{^}{OT1}{94}
9103 \DeclareTextAccent{\`}{OT1}{18}
9104 \DeclareTextAccent{\~}{OT1}{126}

```

The following control sequences are used in `babel.def` but are not defined for PLAIN  $\text{\TeX}$ .

```

9105 \DeclareTextSymbol{\textquotedblleft}{OT1}{92}
9106 \DeclareTextSymbol{\textquotedblright}{OT1}{`\'}
9107 \DeclareTextSymbol{\textquoteleft}{OT1}{``}
9108 \DeclareTextSymbol{\textquoteright}{OT1}{``'}
9109 \DeclareTextSymbol{\i}{OT1}{16}
9110 \DeclareTextSymbol{\ss}{OT1}{25}

```

For a couple of languages we need the  $\text{\LaTeX}$ -control sequence `\scriptsize` to be available. Because plain  $\text{\TeX}$  doesn't have such a sophisticated font mechanism as  $\text{\LaTeX}$  has, we just `\let` it to `\sevenrm`.

```

9111 \ifx\scriptsize\undefined
9112   \let\scriptsize\sevenrm
9113 \fi

```

And a few more “dummy” definitions.

```

  A proxy file:

9139 <*plain>
9140 \input babel.def
9141 </plain>

```

## 15. Acknowledgements

In the initial stages of the development of babel, Bernd Raichle provided many helpful suggestions and Michel Goossens supplied contributions for many languages. Ideas from Nico Poppelier, Piet van Oostrum and many others have been used. Paul Wackers and Werenfried Spit helped find and repair bugs.

More recently, there are significant contributions by Salim Bou, Ulrike Fischer, Loren Davis and Udi Fogiel.

Barbara Beeton has helped in improving the manual.

There are also many contributors for specific languages, which are mentioned in the respective files. Without them, babel just wouldn't exist.
