The babel package is being developed incrementally, which means parts of the code are under development and therefore incomplete. Only documented features are considered complete. In other words, use babel in real documents only as documented (except, of course, if you want to explore and test them).

## 1 Identification and loading of required files

*Code documentation is still under revision.*

The babel package after unpacking consists of the following files:

**babel.sty** is the  $\LaTeX$  package, which set options and load language styles.

**babel.def** is loaded by Plain.

**switch.def** defines macros to set and switch languages (it loads part babel.def).

**plain.def** is not used, and just loads babel.def, for compatibility.

**hyphen.cfg** is the file to be used when generating the formats to load hyphenation patterns.

There some additional tex, def and lua files.

The babel installer extends docstrip with a few “pseudo-guards” to set “variables” used at installation time. They are used with `<@name@>` at the appropriate places in the source code and defined with either `<<name=value>>`, or with a series of lines between `<<*name>>` and `<</name>>`. The latter is cumulative (eg, with *More package options*). That brings a little bit of literate programming. The guards `<-name>` and `<+name>` have been redefined, too. See babel.ins for further details.

## 2 locale directory

A required component of babel is a set of ini files with basic definitions for about 300 languages. They are distributed as a separate zip file, not packed as dtx. Many of them are essentially finished (except bugs and mistakes, of course). Some of them are still incomplete (but they will be usable), and there are some omissions (eg, there are no geographic areas in Spanish). Not all include LICR variants.

babel-\*.ini files contain the actual data; babel-\*.tex files are basically proxies to the corresponding ini files.

See [Keys in ini files](#) in the the babel site.

## 3 Tools

```
1 <<version=24.10.62871>>
2 <<date=2024/09/19>>
```

**Do not use the following macros in ldf files. They may change in the future.** This applies mainly to those recently added for replacing, trimming and looping. The older ones, like `\bbl@afterfi`, will not change. We define some basic macros which just make the code cleaner. `\bbl@add` is now used internally instead of `\addto` because of the unpredictable behavior of the latter. Used in babel.def and in babel.sty, which means in  $\LaTeX$  is executed twice, but we need them when defining options and babel.def cannot be load until options have been defined. This does not hurt, but should be fixed somehow.

```
3 <<*Basic macros>> ≡
4 \bbl@trace{Basic macros}
5 \def\bbl@stripslash{\expandafter\@gobble\string}
6 \def\bbl@add#1#2{%
7   \bbl@ifunset{\bbl@stripslash#1}%
8     {\def#1{#2}}%
9     {\expandafter\def\expandafter#1\expandafter{#1#2}}}
10 \def\bbl@xin@{\@expandtwoargs\in@}
11 \def\bbl@carg#1#2{\expandafter#1\csname#2\endcsname}%
12 \def\bbl@ncarg#1#2#3{\expandafter#1\expandafter#2\csname#3\endcsname}%
13 \def\bbl@ccarg#1#2#3{%
14   \expandafter#1\csname#2\expandafter\endcsname\csname#3\endcsname}%
15 \def\bbl@carg#1#2{\expandafter#1\csname bbl@#2\endcsname}%
16 \def\bbl@cs#1{\csname bbl@#1\endcsname}
17 \def\bbl@cl#1{\csname bbl@#1\language\endcsname}
18 \def\bbl@loop#1#2#3{\bbl@loop#1{#3}#2,\@nnil,}
```

```

19 \def\bbl@loopx#1#2{\expandafter\bbl@loop\expandafter#1\expandafter{#2}}
20 \def\bbl@loop#1#2#3,{%
21   \ifx\@nnil#3\relax\else
22     \def#1{#3}#2\bbl@afterfi\bbl@loop#1{#2}%
23   \fi}
24 \def\bbl@for#1#2#3{\bbl@loopx#1{#2}{\ifx#1\@empty\else#3\fi}}

```

**\bbl@add@list** This internal macro adds its second argument to a comma separated list in its first argument. When the list is not defined yet (or empty), it will be initiated. It presumes expandable character strings.

```

25 \def\bbl@add@list#1#2{%
26   \edef#1{%
27     \bbl@ifunset{\bbl@stripslash#1}%
28     }%
29     {\ifx#1\@empty\else#1,\fi}%
30   #2}}

```

### **\bbl@afterelse**

**\bbl@afterfi** Because the code that is used in the handling of active characters may need to look ahead, we take extra care to ‘throw’ it over the `\else` and `\fi` parts of an `\if`-statement<sup>1</sup>. These macros will break if another `\if... \fi` statement appears in one of the arguments and it is not enclosed in braces.

```

31 \long\def\bbl@afterelse#1\else#2\fi{\fi#1}
32 \long\def\bbl@afterfi#1\fi{\fi#1}

```

**\bbl@exp** Now, just syntactical sugar, but it makes partial expansion of some code a lot more simple and readable. Here `\` stands for `\noexpand`, `\<.` for `\noexpand` applied to a built macro name (which does not define the macro if undefined to `\relax`, because it is created locally), and `\[...]` for one-level expansion (where `...` is the macro name without the backslash). The result may be followed by extra arguments, if necessary.

```

33 \def\bbl@exp#1{%
34   \begingroup
35   \let\<\noexpand
36   \let\<\bbl@exp@en
37   \let\[\bbl@exp@ue
38   \edef\bbl@exp@aux{\endgroup#1}%
39   \bbl@exp@aux}
40 \def\bbl@exp@en#1>{\expandafter\noexpand\csname#1\endcsname}%
41 \def\bbl@exp@ue#1{%
42   \unexpanded\expandafter\expandafter\expandafter{\csname#1\endcsname}}%

```

**\bbl@trim** The following piece of code is stolen (with some changes) from `keyval`, by David Carlisle. It defines two macros: `\bbl@trim` and `\bbl@trim@def`. The first one strips the leading and trailing spaces from the second argument and then applies the first argument (a macro, `\toks@` and the like). The second one, as its name suggests, defines the first argument as the stripped second argument.

```

43 \def\bbl@tempa#1{%
44   \long\def\bbl@trim##1##2{%
45     \futurelet\bbl@trim@a\bbl@trim@c##2\@nil\@nil#1\@nil\relax{##1}}%
46   \def\bbl@trim@c{%
47     \ifx\bbl@trim@a\@sptoken
48       \expandafter\bbl@trim@b
49     \else
50       \expandafter\bbl@trim@b\expandafter#1%
51     \fi}%
52   \long\def\bbl@trim@b#1##1 \@nil{\bbl@trim@i##1}}
53 \bbl@tempa{ }
54 \long\def\bbl@trim@i#1\@nil#2\relax#3{#3{#1}}
55 \long\def\bbl@trim@def#1{\bbl@trim{\def#1}}

```

<sup>1</sup>This code is based on code presented in TUGboat vol. 12, no2, June 1991 in “An expansion Power Lemma” by Sonja Maus.

**\bbl@ifunset** To check if a macro is defined, we create a new macro, which does the same as `\ifundefined`. However, in an  $\epsilon$ -tex engine, it is based on `\ifcurname`, which is more efficient, and does not waste memory. Defined inside a group, to avoid `\ifcurname` being implicitly set to `\relax` by the `\curname` test.

```

56 \begingroup
57   \gdef\bbl@ifunset#1{%
58     \expandafter\ifx\curname#1\endcurname\relax
59     \expandafter\@firstoftwo
60   \else
61     \expandafter\@secondoftwo
62   \fi}
63 \bbl@ifunset{ifcurname}%
64 {}%
65 {\gdef\bbl@ifunset#1{%
66   \ifcurname#1\endcurname
67   \expandafter\ifx\curname#1\endcurname\relax
68   \bbl@afterelse\expandafter\@firstoftwo
69   \else
70     \bbl@afterfi\expandafter\@secondoftwo
71   \fi
72   \else
73     \expandafter\@firstoftwo
74   \fi}}
75 \endgroup

```

**\bbl@ifblank** A tool from url, by Donald Arseneau, which tests if a string is empty or space. The companion macros tests if a macro is defined with some ‘real’ value, ie, not `\relax` and not empty,

```

76 \def\bbl@ifblank#1{%
77   \bbl@ifblank@i#1\@nil\@secondoftwo\@firstoftwo\@nil}
78 \long\def\bbl@ifblank@i#1#2\@nil#3#4#5\@nil{#4}
79 \def\bbl@ifset#1#2#3{%
80   \bbl@ifunset{#1}{#3}{\bbl@exp{\bbl@ifblank{\@nameuse{#1}}}{#3}{#2}}}

```

For each element in the comma separated `<key>=<value>` list, execute `<code>` with #1 and #2 as the key and the value of current item (trimmed). In addition, the item is passed verbatim as #3. With the `<key>` alone, it passes `\empty` (ie, the macro thus named, not an empty argument, which is what you get with `<key>=` and no value).

```

81 \def\bbl@forkv#1#2{%
82   \def\bbl@kvcmd##1##2##3{#2}%
83   \bbl@kvnext#1,\@nil,}
84 \def\bbl@kvnext#1,{%
85   \ifx\@nil#1\relax\else
86     \bbl@ifblank{#1}{\bbl@forkv@eq#1=\empty=\@nil{#1}}%
87     \expandafter\bbl@kvnext
88   \fi}
89 \def\bbl@forkv@eq#1=#2=#3\@nil#4{%
90   \bbl@trim\def\bbl@forkv@a{#1}%
91   \bbl@trim{\expandafter\bbl@kvcmd\expandafter{\bbl@forkv@a}}{#2}{#4}}

```

A *for* loop. Each item (trimmed) is #1. It cannot be nested (it’s doable, but we don’t need it).

```

92 \def\bbl@vforeach#1#2{%
93   \def\bbl@forcmd##1{#2}%
94   \bbl@fornext#1,\@nil,}
95 \def\bbl@fornext#1,{%
96   \ifx\@nil#1\relax\else
97     \bbl@ifblank{#1}{\bbl@trim\bbl@forcmd{#1}}%
98     \expandafter\bbl@fornext
99   \fi}
100 \def\bbl@foreach#1{\expandafter\bbl@vforeach\expandafter{#1}}

```

**\bbl@replace** Returns implicitly `\toks@` with the modified string.

```

101 \def\bbl@replace#1#2#3{% in #1 -> repl #2 by #3

```

```

102 \toks@{}%
103 \def\bbl@replace@aux##1#2##2#2{%
104   \ifx\bbl@nil##2%
105     \toks@\expandafter{\the\toks@##1}%
106   \else
107     \toks@\expandafter{\the\toks@##1#3}%
108     \bbl@afterfi
109     \bbl@replace@aux##2#2%
110   \fi}%
111 \expandafter\bbl@replace@aux#1#2\bbl@nil#2%
112 \edef#1{\the\toks@}

```

An extension to the previous macro. It takes into account the parameters, and it is string based (ie, if you replace elax by ho, then \relax becomes \rho). No checking is done at all, because it is not a general purpose macro, and it is used by babel only when it works (an example where it does *not* work is in \bbl@TG@@date, and also fails if there are macros with spaces, because they are retokenized). It may change! (or even merged with \bbl@replace; I'm not sure checking the replacement is really necessary or just paranoia).

```

113 \ifx\detokenize@\undefined\else % Unused macros if old Plain TeX
114   \bbl@exp{\def\\bbl@parsedef##1\detokenize{macro:}}#2->#3\relax}%
115   \def\bbl@tempa{#1}%
116   \def\bbl@tempb{#2}%
117   \def\bbl@tempe{#3}}
118 \def\bbl@sreplace#1#2#3{%
119   \begingroup
120     \expandafter\bbl@parsedef\meaning#1\relax
121     \def\bbl@tempc{#2}%
122     \edef\bbl@tempc{\expandafter\strip@prefix\meaning\bbl@tempc}%
123     \def\bbl@tempd{#3}%
124     \edef\bbl@tempd{\expandafter\strip@prefix\meaning\bbl@tempd}%
125     \bbl@xin@{\bbl@tempc}{\bbl@tempe}% If not in macro, do nothing
126     \ifin@
127       \bbl@exp{\\bbl@replace\\bbl@tempe{\bbl@tempc}{\bbl@tempd}}%
128       \def\bbl@tempc{%      Expanded an executed below as 'uplevel'
129         \\makeatletter % "internal" macros with @ are assumed
130         \\scantokens{%
131           \bbl@tempa\\@namedef{\bbl@stripslash#1}\bbl@tempb{\bbl@tempe}}%
132         \catcode64=\the\catcode64\relax}% Restore @
133     \else
134       \let\bbl@tempc\empty % Not \relax
135     \fi
136     \bbl@exp{%      For the 'uplevel' assignments
137   \endgroup
138   \bbl@tempc}} % empty or expand to set #1 with changes
139 \fi

```

Two further tools. \bbl@ifsamestring first expand its arguments and then compare their expansion (sanitized, so that the catcodes do not matter). \bbl@engine takes the following values: 0 is pdfTeX, 1 is luatex, and 2 is xetex. You may use the latter it in your language style if you want.

```

140 \def\bbl@ifsamestring#1#2{%
141   \begingroup
142     \protected@edef\bbl@tempb{#1}%
143     \edef\bbl@tempb{\expandafter\strip@prefix\meaning\bbl@tempb}%
144     \protected@edef\bbl@tempc{#2}%
145     \edef\bbl@tempc{\expandafter\strip@prefix\meaning\bbl@tempc}%
146     \ifx\bbl@tempb\bbl@tempc
147       \aftergroup\@firstoftwo
148     \else
149       \aftergroup\@secondoftwo
150     \fi
151   \endgroup}
152 \chardef\bbl@engine=%
153 \ifx\directlua\undefined
154   \ifx\XeTeXinputencoding\undefined

```

```

155     \z@
156   \else
157     \tw@
158   \fi
159 \else
160   \@ne
161 \fi

```

A somewhat hackish tool (hence its name) to avoid spurious spaces in some contexts.

```

162 \def\bbl@bsphack{%
163   \ifhmode
164     \hskip\z@skip
165   \def\bbl@esphack{\loop\ifdim\lastskip>\z@\unskip\repeat\unskip}%
166   \else
167     \let\bbl@esphack\@empty
168   \fi}

```

Another hackish tool, to apply case changes inside a protected macros. It's based on the internal `\let`'s made by `\MakeUppercase` and `\MakeLowercase` between things like `\oe` and `\OE`.

```

169 \def\bbl@cased{%
170   \ifx\oe\OE
171     \expandafter\in@\expandafter
172       {\expandafter\OE\expandafter}\expandafter{\oe}%
173   \ifin@
174     \bbl@afterelse\expandafter\MakeUppercase
175   \else
176     \bbl@afterfi\expandafter\MakeLowercase
177   \fi
178 \else
179   \expandafter\@firstofone
180 \fi}

```

The following adds some code to `\extras...` both before and after, while avoiding doing it twice. It's somewhat convoluted, to deal with `#`'s. Used to deal with `alph`, `Alph` and frenchspacing when there are already changes (with `\babel@save`).

```

181 \def\bbl@extras@wrap#1#2#3{% 1:in-test, 2:before, 3:after
182   \toks@\expandafter\expandafter\expandafter{%
183     \csname extras\language\endcsname}%
184   \bbl@exp{\in@{#1}{\the\toks@}}%
185   \ifin@
186     \temptokena{#2}%
187     \edef\bbl@tempc{\the\temptokena\the\toks@}%
188     \toks@\expandafter{\bbl@tempc#3}%
189     \expandafter\edef\csname extras\language\endcsname{\the\toks@}%
190   \fi}
191 <</Basic macros>>

```

Some files identify themselves with a  $\LaTeX$  macro. The following code is placed before them to define (and then undefine) if not in  $\LaTeX$ .

```

192 <<(*Make sure ProvidesFile is defined)>> \equiv
193 \ifx\ProvidesFile\@undefined
194   \def\ProvidesFile#1[#2 #3 #4]{%
195     \wlog{File: #1 #4 #3 <#2>}%
196     \let\ProvidesFile\@undefined}
197 \fi
198 <</Make sure ProvidesFile is defined>>

```

### 3.1 Multiple languages

**\language** Plain  $\TeX$  version 3.0 provides the primitive `\language` that is used to store the current language. When used with a pre-3.0 version this function has to be implemented by allocating a counter. The following block is used in `switch.def` and `hyphen.cfg`; the latter may seem redundant, but remember `babel` doesn't requires loading `switch.def` in the format.

```

199 <<*Define core switching macros>> ≡
200 \ifx\language\undefined
201   \csname newcount\endcsname\language
202 \fi
203 <</Define core switching macros>>

```

**\last@language** Another counter is used to keep track of the allocated languages.  $\TeX$  and  $\LaTeX$  reserves for this purpose the count 19.

**\addlanguage** This macro was introduced for  $\TeX$  < 2. Preserved for compatibility.

```

204 <<*Define core switching macros>> ≡
205 \countdef\last@language=19
206 \def\addlanguage{\csname newlanguage\endcsname}
207 <</Define core switching macros>>

```

Now we make sure all required files are loaded. When the command `\AtBeginDocument` doesn't exist we assume that we are dealing with a plain-based format. In that case the file `plain.def` is needed (which also defines `\AtBeginDocument`, and therefore it is not loaded twice). We need the first part when the format is created, and `\orig@dump` is used as a flag. Otherwise, we need to use the second part, so `\orig@dump` is not defined (`plain.def` undefines it). Check if the current version of `switch.def` has been previously loaded (mainly, `hyphen.cfg`). If not, load it now. We cannot load `babel.def` here because we first need to declare and process the package options.

## 3.2 The Package File ( $\LaTeX$ , `babel.sty`)

```

208 <*package>
209 \NeedsTeXFormat{LaTeX2e}[2005/12/01]
210 \ProvidesPackage{babel}[<@date@> v<@version@> The Babel package]

```

Start with some “private” debugging tool, and then define macros for errors.

```

211 \ifpackagewith{babel}{debug}
212   {\providecommand\bbl@trace[1]{\message{^^J[ #1 ]}}%
213   \let\bbl@debug\@firstofone
214   \ifx\directlua\undefined\else
215     \directlua{ Babel = Babel or {}
216     Babel.debug = true }%
217     \input{babel-debug.tex}%
218   \fi}
219 {\providecommand\bbl@trace[1]{}%
220 \let\bbl@debug\@gobble
221 \ifx\directlua\undefined\else
222   \directlua{ Babel = Babel or {}
223   Babel.debug = false }%
224 \fi}
225 \def\bbl@error#1{% Implicit #2#3#4
226   \begingroup
227     \catcode`\=0 \catcode`\==12 \catcode`\`=12
228     \input errbabel.def
229   \endgroup
230   \bbl@error{#1}}
231 \def\bbl@warning#1{%

This file also takes care of a number of compatibility issues with other packages and defines a few additional package options. Apart from all the language options below we also have a few options that influence the behavior of language definition files.

Many of the following options don't do anything themselves, they are just defined in order to make it possible for babel and language definition files to check if one of them was specified by the user.

But first, include here the *Basic macros* defined above.

```

246 <@Basic macros@>
247 \ifpackagewith{babel}{silent}
248 {\let\bbl@info@gobble
249 \let\bbl@infowarn@gobble
250 \let\bbl@warning@gobble}
251 {}
252 %
253 \def\AfterBabelLanguage#1{%
254 \global\expandafter\bbl@add\csname#1.ldf-h@@k\endcsname}%

```

If the format created a list of loaded languages (in \bbl@languages), get the name of the 0-th to show the actual language used. Also available with base, because it just shows info.

```

255 \ifx\bbl@languages\undefined\else
256 \begingroup
257 \catcode`\^^I=12
258 \ifpackagewith{babel}{showlanguages}{%
259 \begingroup
260 \def\bbl@elt#1#2#3#4{\wlog{#2^^I#1^^I#3^^I#4}}%
261 \wlog{<*languages>}%
262 \bbl@languages
263 \wlog{</languages>}%
264 \endgroup}{%
265 \endgroup

269 \def\bbl@elt##1##2##3##4{%
270 \fi}%
271 \bbl@languages
272 \fi%

```

### 3.3 base

The first 'real' option to be processed is base, which set the hyphenation patterns then resets ver@babel.sty so that  $\TeX$  forgets about the first loading. After a subset of babel.def has been loaded (the old switch.def) and \AfterBabelLanguage defined, it exits.

Now the base option. With it we can define (and load, with luatex) hyphenation patterns, even if we are not interested in the rest of babel.

```

273 \bbl@trace{Defining option 'base'}
274 \ifpackagewith{babel}{base}{%
275 \let\bbl@onlyswitch@empty

292 \endinput}{}%

```

### 3.4 key=value options and other general option

The following macros extract language modifiers, and only real package options are kept in the option list. Modifiers are saved and assigned to `\BabelModifiers` at `\bbl@load@language`; when no modifiers have been given, the former is `\relax`.

```

293 \bbl@trace{key=value and another general options}
294 \bbl@csarg\let{tempa\expandafter}\csname opt@babel.sty\endcsname
295 \def\bbl@tempb#1.#2{% Remove trailing dot
296   #1\ifx\@empty#2\else,\bbl@afterfi\bbl@tempb#2\fi}%
297 \def\bbl@tempe#1=#2\@@{%
298   \bbl@csarg\edef{mod@#1}{\bbl@tempb#2}}
299 \def\bbl@tempd#1.#2\@nnil{%%^A TODO. Refactor lists?

307     \else
308       \in@{${modifiers$}}{${1$}}%%^A TODO. Allow spaces.
309       \ifin@
310         \bbl@tempe#2\@@
311       \else
312         \in@{=}{#1}%
313         \ifin@
314           \edef\bbl@tempc{\ifx\bbl@tempc\@empty\else\bbl@tempc,\fi#1.#2}%
315         \else
316           \edef\bbl@tempc{\ifx\bbl@tempc\@empty\else\bbl@tempc,\fi#1}%
317           \bbl@csarg\edef{mod@#1}{\bbl@tempb#2}%
318         \fi
319       \fi
320     \fi
321   \fi}
322 \let\bbl@tempc\@empty
323 \bbl@foreach\bbl@tempa{\bbl@tempd#1.\@empty\@nnil}
324 \expandafter\let\csname opt@babel.sty\endcsname\bbl@tempc

```

The next option tells babel to leave shorthand characters active at the end of processing the package. This is *not* the default as it can cause problems with other packages, but for those who want to use the shorthand characters in the preamble of their documents this can help.

```

325 \DeclareOption{KeepShorthandsActive}{}
326 \DeclareOption{activeacute}{}
327 \DeclareOption{activegrave}{}
328 \DeclareOption{debug}{}
329 \DeclareOption{noconfigs}{}
330 \DeclareOption{showlanguages}{}
331 \DeclareOption{silent}{}
332 \DeclareOption{shorthands=off}{\bbl@tempa shorthands=\bbl@tempa}
333 \chardef\bbl@iniflag\z@
334 \DeclareOption{provide=*}{\chardef\bbl@iniflag\@ne} % main -> +1
335 \DeclareOption{provide+=*}{\chardef\bbl@iniflag\tw@} % second = 2
336 \DeclareOption{provide*=*}{\chardef\bbl@iniflag\thr@@} % second + main
337 % A separate option
338 \let\bbl@autoload@options\@empty
339 \DeclareOption{provide=@*}{\def\bbl@autoload@options{import}}
340 % Don't use. Experimental. TODO.
341 \newif\ifbbl@single
342 \DeclareOption{selectors=off}{\bbl@singletrue}

```

```
343 <@More package options@>
```

Handling of package options is done in three passes. (I [JBL] am not very happy with the idea, anyway.) The first one processes options which has been declared above or follow the syntax  $\langle key \rangle = \langle value \rangle$ , the second one loads the requested languages, except the main one if set with the key main, and the third one loads the latter. First, we “flag” valid keys with a nil value.

```
344 \let\bbl@opt@shorthands\@nnil
345 \let\bbl@opt@config\@nnil
346 \let\bbl@opt@main\@nnil
347 \let\bbl@opt@headfoot\@nnil
348 \let\bbl@opt@layout\@nnil
349 \let\bbl@opt@provide\@nnil
```

The following tool is defined temporarily to store the values of options.

```
350 \def\bbl@tempa#1=#2\bbl@tempa{%
351   \bbl@csarg\ifx{opt@#1}\@nnil
352     \bbl@csarg\edef{opt@#1}{#2}%
353   \else
354     \bbl@error{bad-package-option}{#1}{#2}{}%
355   \fi}
```

Now the option list is processed, taking into account only currently declared options (including those declared with a =), and  $\langle key \rangle = \langle value \rangle$  options (the former take precedence). Unrecognized options are saved in `\bbl@language@opts`, because they are language options.

```
356 \let\bbl@language@opts\@empty
357 \DeclareOption*{%
358   \bbl@xin{\string=}{\CurrentOption}%
359   \ifin@
360     \expandafter\bbl@tempa\CurrentOption\bbl@tempa
361   \else
362     \bbl@add@list\bbl@language@opts{\CurrentOption}%
363   \fi}
```

Now we finish the first pass (and start over).

```
364 \ProcessOptions*
365 \ifx\bbl@opt@provide\@nnil
366   \let\bbl@opt@provide\@empty %%% MOVE above
367 \else
368   \chardef\bbl@iniflag\@ne
369   \bbl@exp{\bbl@forkv{\@nameuse{@raw@opt@babel.sty}}}{%
370     \in{,provide,}{, #1,}%
371     \ifin@
372       \def\bbl@opt@provide{#2}%
373       \bbl@replace\bbl@opt@provide{;}{,}%
374     \fi}
375 \fi
376 %
```

### 3.5 Conditional loading of shorthands

If there is no shorthands= $\langle chars \rangle$ , the original babel macros are left untouched, but if there is, these macros are wrapped (in `babel.def`) to define only those given.

A bit of optimization: if there is no shorthands=, then `\bbl@ifshorthand` is always true, and it is always false if shorthands is empty. Also, some code makes sense only with shorthands=...

```
377 \bbl@trace{Conditional loading of shorthands}
378 \def\bbl@sh@string#1{%
379   \ifx#1\@empty\else
380     \ifx#1t\string~%
381     \else\ifx#1c\string,%
382     \else\string#1%
383   \fi\fi
384   \expandafter\bbl@sh@string
385 \fi}
```

```

386 \ifx\bbl@opt@shorthands\@nnil
387 \def\bbl@ifshorthand#1#2#3{#2}%
388 \else\ifx\bbl@opt@shorthands\@empty
389 \def\bbl@ifshorthand#1#2#3{#3}%
390 \else

```

The following macro tests if a shorthand is one of the allowed ones.

```

391 \def\bbl@ifshorthand#1{%
392 \bbl@xin@{\string#1}{\bbl@opt@shorthands}%
393 \ifin@
394 \expandafter\@firstoftwo
395 \else
396 \expandafter\@secondoftwo
397 \fi}

```

We make sure all chars in the string are ‘other’, with the help of an auxiliary macro defined above (which also zaps spaces).

```

398 \edef\bbl@opt@shorthands{%
399 \expandafter\bbl@sh@string\bbl@opt@shorthands\@empty}%

```

The following is ignored with shorthands=off, since it is intended to take some additional actions for certain chars.

```

400 \bbl@ifshorthand{'}%
401 {\PassOptionsToPackage{activeacute}{babel}}{}
402 \bbl@ifshorthand{'}%
403 {\PassOptionsToPackage{activegrave}{babel}}{}
404 \fi\fi

```

With headfoot=lang we can set the language used in heads/foots. For example, in babel/3796 just add headfoot=english. It misuses \@resetactivechars, but seems to work.

```

405 \ifx\bbl@opt@headfoot\@nnil\else
406 \g@addto@macro\@resetactivechars{%
407 \set@typeset@protect
408 \expandafter\select@language@x\expandafter{\bbl@opt@headfoot}%
409 \let\protect\noexpand}
410 \fi

```

For the option safe we use a different approach – \bbl@opt@safe says which macros are redefined (B for bibs and R for refs). By default, both are currently set, but in a future release it will be set to none.

```

411 \ifx\bbl@opt@safe\@undefined
412 \def\bbl@opt@safe{BR}
413 % \let\bbl@opt@safe\@empty % Pending of \cite
414 \fi

```

For layout an auxiliary macro is provided, available for packages and language styles. Optimization: if there is no layout, just do nothing.

```

415 \bbl@trace{Defining IfBabelLayout}
416 \ifx\bbl@opt@layout\@nnil
417 \newcommand\IfBabelLayout[3]{#3}%
418 \else
419 \bbl@exp{\bbl@forkv{\@nameuse{@raw@opt@babel.sty}}}{%
420 \in@{,layout,}{, #1,}%
421 \ifin@
422 \def\bbl@opt@layout{#2}%
423 \bbl@replace\bbl@opt@layout{ }{.}%
424 \fi}
425 \newcommand\IfBabelLayout[1]{%
426 \@expandtwoargs\in@{.#1.}{.\bbl@opt@layout.}%
427 \ifin@
428 \expandafter\@firstoftwo
429 \else
430 \expandafter\@secondoftwo
431 \fi}
432 \fi
433 </package>
434 <*core>

```

### 3.6 Interlude for Plain

Because of the way docstrip works, we need to insert some code for Plain here. However, the tools provided by the babel installer for literate programming makes this section a short interlude, because the actual code is below, tagged as *Emulate LaTeX*.

```
435 \ifx\ldf@quit\undefined\else
436 \endinput\fi % Same line!
437 <@Make sure ProvidesFile is defined@>
438 \ProvidesFile{babel.def}[<@date@> v<@version@> Babel common definitions]
439 \ifx\AtBeginDocument\undefined %^^A TODO. change test.
440 <@Emulate LaTeX@>
441 \fi
442 <@Basic macros@>
```

That is all for the moment. Now follows some common stuff, for both Plain and  $\TeX$ . After it, we will resume the  $\TeX$ -only stuff.

```
443 </core>
444 <{*package | core}>
```

## 4 Multiple languages

This is not a separate file (switch.def) anymore.

Plain  $\TeX$  version 3.0 provides the primitive `\language` that is used to store the current language. When used with a pre-3.0 version this function has to be implemented by allocating a counter.

```
445 \def\bbl@version{<@version@>}
446 \def\bbl@date{<@date@>}
447 <@Define core switching macros@>
```

**\adddialect** The macro `\adddialect` can be used to add the name of a dialect or variant language, for which an already defined hyphenation table can be used.

```
448 \def\adddialect#1#2{%
449   \global\chardef#1#2\relax
450   \bbl@usehooks{adddialect}{\{#1\}\{#2\}}%
451   \begingroup
452     \count@#1\relax
453     \def\bbl@elt##1##2###3###4{%
454       \ifnum\count@=##2\relax
455         \edef\bbl@tempa{\expandafter\@gobbletwo\string#1}%
456         \bbl@info{Hyphen rules for '\expandafter\@gobble\bbl@tempa'
457           set to \expandafter\string\csname l@##1\endcsname\}%
458         (\string\language\the\count@). Reported}%
459         \def\bbl@elt####1####2####3####4{%
460           \fi}%
461         \bbl@cs{languages}%
462         \endgroup}
```

`\bbl@iflanguage` executes code only if the language `l@` exists. Otherwise raises an error. The argument of `\bbl@fixname` has to be a macro name, as it may get “fixed” if casing (lc/uc) is wrong. It’s an attempt to fix a long-standing bug when `\foreignlanguage` and the like appear in a `\MakeXXXcase`. However, a lowercase form is not imposed to improve backward compatibility (perhaps you defined a language named MYLANG, but unfortunately mixed case names cannot be trapped). Note `l@` is encapsulated, so that its case does not change.

```
463 \def\bbl@fixname#1{%
464   \begingroup
465   \def\bbl@tempe{l@}%
466   \edef\bbl@tempd{\noexpand\@ifundefined{\noexpand\bbl@tempe#1}}%
467   \bbl@tempd
468   {\lowercase\expandafter{\bbl@tempd}%
469    {\uppercase\expandafter{\bbl@tempd}%
470     \@empty
471     {\edef\bbl@tempd{\def\noexpand#1{#1}}}%
472     \endgroup}}
```

```

472         \uppercase\expandafter{\bbl@tempd}}}%
473     {\edef\bbl@tempd{\def\noexpand#1{#1}}}%
474     \lowercase\expandafter{\bbl@tempd}}}%
475     \@empty
476     \edef\bbl@tempd{\endgroup\def\noexpand#1{#1}}%
477     \bbl@tempd

479 \def\bbl@iflanguage#1{%
480     \ifundefined{l#1}{\@nolanerr{#1}\@gobble}\@firstofone}

```

After a name has been ‘fixed’, the selectors will try to load the language. If even the fixed name is not defined, will load it on the fly, either based on its name, or if activated, its BCP47 code.

We first need a couple of macros for a simple BCP 47 look up. It also makes sure, with \bbl@bcpcase, casing is the correct one, so that sr-latn-ba becomes fr-Latn-BA. Note #4 may contain some \@empty’s, but they are eventually removed. \bbl@bcpllookup either returns the found ini or it is \relax.

```

481 \def\bbl@bcpcase#1#2#3#4\@#5{%

552 </package>
553 <{*package | core}>

```

**\iflanguage** Users might want to test (in a private package for instance) which language is currently active. For this we provide a test macro, `\iflanguage`, that has three arguments. It checks whether the first argument is a known language. If so, it compares the first argument with the value of `\language`. Then, depending on the result of the comparison, it executes either the second or the third argument.

```

554 \def\iflanguage#1{%
555 \bbl@iflanguage{#1}%
556 \ifnum\csname l@#1\endcsname=\language
557 \expandafter\@firstoftwo
558 \else
559 \expandafter\@secondoftwo
560 \fi}}

```

## 4.1 Selecting the language

**\selectlanguage** The macro `\selectlanguage` checks whether the language is already defined before it performs its actual task, which is to update `\language` and activate language-specific definitions.

```

561 \let\bbl@select@type\z@
562 \edef\selectlanguage{%
563 \noexpand\protect
564 \expandafter\noexpand\csname selectlanguage\endcsname}

```

Because the command `\selectlanguage` could be used in a moving argument it expands to `\protect\selectlanguage_`. Therefore, we have to make sure that a macro `\protect` exists. If it doesn't it is `\let` to `\relax`.

```

565 \ifx\@undefined\protect\let\protect\relax\fi

```

The following definition is preserved for backwards compatibility (eg, arabi, koma). It is related to a trick for 2.09, now discarded.

```

566 \let\xstring\string

```

Since version 3.5 babel writes entries to the auxiliary files in order to typeset table of contents etc. in the correct language environment.

**\bbl@pop@language** But when the language change happens *inside* a group the end of the group doesn't write anything to the auxiliary files. Therefore we need TeX's `aftergroup` mechanism to help us. The command `\aftergroup` stores the token immediately following it to be executed when the current group is closed. So we define a temporary control sequence `\bbl@pop@language` to be executed at the end of the group. It calls `\bbl@set@language` with the name of the current language as its argument.

**\bbl@language@stack** The previous solution works for one level of nesting groups, but as soon as more levels are used it is no longer adequate. For that case we need to keep track of the nested languages using a stack mechanism. This stack is called `\bbl@language@stack` and initially empty.

```
567 \def\bbl@language@stack{}
```

When using a stack we need a mechanism to push an element on the stack and to retrieve the information afterwards.

**\bbl@push@language**

**\bbl@pop@language** The stack is simply a list of languagenames, separated with a '+' sign; the push function can be simple:

```
568 \def\bbl@push@language{%
569   \ifx\language\@undefined\else
570     \ifx\currentgrouplevel\@undefined
571       \xdef\bbl@language@stack{\language+\bbl@language@stack}%
572     \else
573       \ifnum\currentgrouplevel=\z@
574         \xdef\bbl@language@stack{\language+}%
575       \else
576         \xdef\bbl@language@stack{\language+\bbl@language@stack}%
577       \fi
578     \fi
579 }
```

Retrieving information from the stack is a little bit less simple, as we need to remove the element from the stack while storing it in the macro `\language`. For this we first define a helper function.

**\bbl@pop@lang** This macro stores its first element (which is delimited by the '+'-sign) in `\language` and stores the rest of the string in `\bbl@language@stack`.

```
580 \def\bbl@pop@lang#1+#2\@{%
581   \edef\language{#1}%
582   \xdef\bbl@language@stack{#2}}
```

The reason for the somewhat weird arrangement of arguments to the helper function is the fact it is called in the following way. This means that before `\bbl@pop@lang` is executed TeX first *expands* the stack, stored in `\bbl@language@stack`. The result of that is that the argument string of `\bbl@pop@lang` contains one or more language names, each followed by a '+'-sign (zero language names won't occur as this macro will only be called after something has been pushed on the stack).

```
583 \let\bbl@ifrestoring\@secondoftwo
584 \def\bbl@pop@language{%
585   \expandafter\bbl@pop@lang\bbl@language@stack\@
586   \let\bbl@ifrestoring\@firstoftwo
587   \expandafter\bbl@set@language\expandafter{\language}%
588   \let\bbl@ifrestoring\@secondoftwo}
```

Once the name of the previous language is retrieved from the stack, it is fed to `\bbl@set@language` to do the actual work of switching everything that needs switching.

An alternative way to identify languages (in the babel sense) with a numerical value is introduced in 3.30. This is one of the first steps for a new interface based on the concept of locale, which explains the name of `\localeid`. This means `\l@.` . . will be reserved for hyphenation patterns (so that two locales can share the same rules).

```
589 \chardef\localeid\z@
590 \def\bbl@id@last{0} % No real need for a new counter
591 \def\bbl@id@assign{%
```

```

592 \bbl@ifunset{\bbl@id@\language}%
593 {\count\bbl@id\last\relax
594 \advance\count@one
595 \bbl@csarg\chardef{id@\language}\count@
596 \edef\bbl@id\last{\the\count@}%
597 \ifcase\bbl@engine\or
598 \directlua{
599     Babel = Babel or {}
600     Babel.locale_props = Babel.locale_props or {}
601     Babel.locale_props[\bbl@id\last] = {}
602     Babel.locale_props[\bbl@id\last].name = '\language'
603 }%
604 \fi}%
605 }%
606 \chardef\localeid\bbl@cl{id@}}

```

The unprotected part of `\selectlanguage`. In case it is used as environment, declare `\endselectlanguage`, just for safety.

```

607 \expandafter\def\csname selectlanguage \endcsname#1{%
608 \ifnum\bbl@hymapsel=\@cc\lv\let\bbl@hymapsel\tw\fi
609 \bbl@push@language
610 \aftergroup\bbl@pop@language
611 \bbl@set@language{#1}}
612 \let\endselectlanguage\relax

```

**\bbl@set@language** The macro `\bbl@set@language` takes care of switching the language environment *and* of writing entries on the auxiliary files. For historical reasons, language names can be either language of `\language`. To catch either form a trick is used, but unfortunately as a side effect the catcodes of letters in `\language` are messed up. This is a bug, but preserved for backwards compatibility. The list of auxiliary files can be extended by redefining `\BabelContentsFiles`, but make sure they are loaded inside a group (as `aux`, `toc`, `lof`, and `lot` do) or the last language of the document will remain active afterwards. We also write a command to change the current language in the auxiliary files. `\bbl@savelastskip` is used to deal with skips before the write whatsit (as suggested by U Fischer). Adapted from `hyperref`, but it might fail, so I'll consider it a temporary hack, while I study other options (the ideal, but very likely unfeasible except perhaps in `luatex`, is to avoid the `\write` altogether when not needed).

```

```

First, check if the user asks for a known language. If so, update the value of `\language` and call `\originalTeX` to bring  $\TeX$  in a certain pre-defined state.

The name of the language is stored in the control sequence `\language`.

Then we have to *redefine* `\originalTeX` to compensate for the things that have been activated. To save memory space for the macro definition of `\originalTeX`, we construct the control sequence name for the `\noextras{language}` command at definition time by expanding the `\csname` primitive. Now activate the language-specific definitions. This is done by constructing the names of three macros by concatenating three words with the argument of `\selectlanguage`, and calling these macros.

The switching of the values of `\lefthyphenmin` and `\righthyphenmin` is somewhat different. First we save their current values, then we check if `\(language)hyphenmins` is defined. If it is not, we set default values (2 and 3), otherwise the values in `\(language)hyphenmins` will be used.

No text is supposed to be added with switching captions and date, so we remove any spurious spaces with `\bbl@bsphack` and `\bbl@esphack`.

```

At the end of the environment we need to switch off the extra definitions. The grouping mechanism of the environment will take care of resetting the correct hyphenation rules and “extras”.

```

771 \expandafter\let\csname endotherlanguage*\endcsname\relax

```

**\foreignlanguage** The `\foreignlanguage` command is another substitute for the `\selectlanguage` command. This command takes two arguments, the first argument is the name of the language to use for typesetting the text specified in the second argument.

Unlike `\selectlanguage` this command doesn’t switch *everything*, it only switches the hyphenation rules and the extra definitions for the language specified. It does this within a group and assumes the `\extras{language}` command doesn’t make any `\global` changes. The coding is very similar to part of `\selectlanguage`.

`\bbl@beforeforeign` is a trick to fix a bug in bidi texts. `\foreignlanguage` is supposed to be a ‘text’ command, and therefore it must emit a `\leavevmode`, but it does not, and therefore the indent is placed on the opposite margin. For backward compatibility, however, it is done only if a right-to-left script is requested; otherwise, it is no-op.

(3.11) `\foreignlanguage*` is a temporary, experimental macro for a few lines with a different script direction, while preserving the paragraph format (thank the braces around `\par`, things like `\hangindent` are not reset). Do not use it in production, because its semantics and its syntax may change (and very likely will, or even it could be removed altogether). Currently it enters in `vmode` and then selects the language (which in turn sets the paragraph direction).

(3.11) Also experimental are the hook `foreign` and `foreign*`. With them you can redefine `\BabelText` which by default does nothing. Its behavior is not well defined yet. So, use it in horizontal mode only if you do not want surprises.

In other words, at the beginning of a paragraph `\foreignlanguage` enters into `hmode` with the surrounding lang, and with `\foreignlanguage*` with the new lang.

## 4.2 Errors

### **\@nolanerr**

**\@nopatterns** The babel package will signal an error when a documents tries to select a language that hasn’t been defined earlier. When a user selects a language for which no hyphenation patterns were loaded into the format he will be given a warning about that fact. We revert to the patterns for `\language=0` in that case. In most formats that will be (US)english, but it might also be empty.

**\@noopterr** When the package was loaded without options not everything will work as expected. An error message is issued in that case.

When the format knows about `\PackageError` it must be  $\text{\LaTeX 2}_\epsilon$ , so we can safely use its error handling interface. Otherwise we’ll have to ‘keep it simple’.

Infos are not written to the console, but on the other hand many people think warnings are errors, so a further message type is defined: an important info which is sent to the console.

```

956   \chardef\l@english\z@
957 \fi

```

**\addto** It takes two arguments, a *⟨control sequence⟩* and  $\TeX$ -code to be added to the *⟨control sequence⟩*.

If the *⟨control sequence⟩* has not been defined before it is defined now. The control sequence could also expand to `\relax`, in which case a circular definition results. The net result is a stack overflow. Note there is an inconsistency, because the assignment in the last branch is global.

```

958 \def\addto#1#2{%
959   \ifx#1\@undefined
960     \def#1{#2}%
961   \else
962     \ifx#1\relax
963       \def#1{#2}%
964     \else
965       {\toks@\expandafter{#1#2}%
966        \xdef#1{\the\toks@}}%
967   \fi
968 \fi}

```

The macro `\initiate@active@char` below takes all the necessary actions to make its argument a shorthand character. The real work is performed once for each character. But first we define a little tool.

```

969 \def\bbl@withactive#1#2{%
970   \begingroup
971     \lccode`~=`#2\relax
972     \lowercase{\endgroup#1~}}

```

**\bbl@redefine** To redefine a command, we save the old meaning of the macro. Then we redefine it to call the original macro with the ‘sanitized’ argument. The reason why we do it this way is that we don’t want to redefine the  $\LaTeX$  macros completely in case their definitions change (they have changed in the past). A macro named `\macro` will be saved new control sequences named `\org@macro`.

```

973 \def\bbl@redefine#1{%
974   \edef\bbl@tempa{\bbl@stripslash#1}%
975   \expandafter\let\csname org@\bbl@tempa\endcsname#1%
976   \expandafter\def\csname\bbl@tempa\endcsname}
977 \@onlypreamble\bbl@redefine

```

**\bbl@redefine@long** This version of `\babel@redefine` can be used to redefine `\long` commands such as `\ifthenelse`.

```

978 \def\bbl@redefine@long#1{%
979   \edef\bbl@tempa{\bbl@stripslash#1}%
980   \expandafter\let\csname org@\bbl@tempa\endcsname#1%
981   \long\expandafter\def\csname\bbl@tempa\endcsname}
982 \@onlypreamble\bbl@redefine@long

```

**\bbl@redefineroobust** For commands that are redefined, but which *might* be robust we need a slightly more intelligent macro. A robust command `foo` is defined to expand to `\protect\foo_`. So it is necessary to check whether `\foo_` exists. The result is that the command that is being redefined is always robust afterwards. Therefore all we need to do now is define `\foo_`.

```

983 \def\bbl@redefineroobust#1{%
984   \edef\bbl@tempa{\bbl@stripslash#1}%
985   \bbl@ifunset{\bbl@tempa\space}%
986     {\expandafter\let\csname org@\bbl@tempa\endcsname#1%
987      \bbl@exp{\def\#1{\protect\<\bbl@tempa\space>}}}%
988     {\bbl@exp{\let\<org@\bbl@tempa>\<\bbl@tempa\space>}}}%
989   \@namedef{\bbl@tempa\space}}
990 \@onlypreamble\bbl@redefineroobust

```

### 4.3 Hooks

Admittedly, the current implementation is a somewhat simplistic and does very little to catch errors, but it is meant for developers, after all. `\bbl@usehooks` is the commands used by `babel` to execute hooks defined for an event.

```

991 \bbl@trace{Hooks}
992 \newcommand\AddBabelHook[3][]{%
993   \bbl@ifunset{\bbl@hk@#2}{\EnableBabelHook{#2}}}%
994   \def\bbl@tempa##1,##3=##2,##3\@empty{\def\bbl@tempb{##2}}%

```

```

995 \expandafter\bb@tempa\bb@evargs,#3=,\@empty
996 \bb@ifunset{bb@ev@#2@#3@#1}%
997 {\bb@csarg\bb@add{ev@#3@#1}{\bb@elth{#2}}}%
998 {\bb@csarg\let{ev@#2@#3@#1}\relax}%
999 \bb@csarg\newcommand{ev@#2@#3@#1}{\bb@tempb}}
1000 \newcommand\EnableBabelHook[1]{\bb@csarg\let{hk@#1}\@firstofone}
1001 \newcommand\DisableBabelHook[1]{\bb@csarg\let{hk@#1}\@gobble}
1002 \def\bb@usehooks{\bb@usehooks@lang\language}
1003 \def\bb@usehooks@lang#1#2#3{% Test for Plain
1004 \ifx\UseHook\undefined\else\UseHook{babel/*/#2}\fi
1005 \def\bb@elth##1{%
1006 \bb@cs{hk@##1}{\bb@cs{ev@##1@#2@#3}}}%
1007 \bb@cs{ev@#2@}%
1008 \ifx\language\undefined\else % Test required for Plain (?)
1009 \ifx\UseHook\undefined\else\UseHook{babel/#1/#2}\fi
1010 \def\bb@elth##1{%
1011 \bb@cs{hk@##1}{\bb@cs{ev@##1@#2@#1}#3}}%
1012 \bb@cs{ev@#2@#1}%
1013 \fi}

```

To ensure forward compatibility, arguments in hooks are set implicitly. So, if a further argument is added in the future, there is no need to change the existing code. Note events intended for hyphen.cfg are also loaded (just in case you need them for some reason).

```

1014 \def\bb@evargs{,% <- don't delete this comma
1015 everylanguage=1,loadkernel=1,loadpatterns=1,loadexceptions=1,%
1016 adddialect=2,patterns=2,defaultcommands=0,encodedcommands=2,write=0,%
1017 beforeextras=0,afterextras=0,stopcommands=0,stringprocess=0,%
1018 hyphenation=2,initiateactive=3,afterreset=0,foreign=0,foreign*=0,%
1019 beforestart=0,language=2,begindocument=1}
1020 \ifx\NewHook\undefined\else % Test for Plain (?)
1021 \def\bb@tempa#1=#2\@@{\NewHook{babel/#1}}
1022 \bb@foreach\bb@evargs{\bb@tempa#1\@@}
1023 \fi

```

**\babelensure** The user command just parses the optional argument and creates a new macro named `\bb@e@{language}`. We register a hook at the `afterextras` event which just executes this macro in a “complete” selection (which, if undefined, is `\relax` and does nothing). This part is somewhat involved because we have to make sure things are expanded the correct number of times. The macro `\bb@e@{language}` contains `\bb@ensure{<include>}{<exclude>}{<fontenc>}`, which in turn loops over the macros names in `\bb@captionslist`, excluding (with the help of `\in@`) those in the `exclude` list. If the `fontenc` is given (and not `\relax`), the `\fontencoding` is also added. Then we loop over the `include` list, but if the macro already contains `\foreignlanguage`, nothing is done. Note this macro (1) is not restricted to the preamble, and (2) changes are local.

```

## 4.4 Setting up language files

**\LdfInit** \LdfInit macro takes two arguments. The first argument is the name of the language that will be defined in the language definition file; the second argument is either a control sequence or a string from which a control sequence should be constructed. The existence of the control sequence indicates that the file has been processed before.

At the start of processing a language definition file we always check the category code of the at-sign. We make sure that it is a 'letter' during the processing of the file. We also save its name as the last called option, even if not loaded.

Another character that needs to have the correct category code during processing of language definition files is the equals sign, '=', because it is sometimes used in constructions with the \let primitive. Therefore we store its current catcode and restore it later on.

Now we check whether we should perhaps stop the processing of this file. To do this we first need to check whether the second argument that is passed to \LdfInit is a control sequence. We do that by looking at the first token after passing #2 through string. When it is equal to \@backslashchar we are dealing with a control sequence which we can compare with \@undefined.

If so, we call \ldf@quit to set the main language, restore the category code of the @-sign and call \endinput

When #2 was *not* a control sequence we construct one and compare it with \relax. Finally we check \originalTeX.

```

1088 \bbl@trace{Macros for setting language files up}
1089 \def\bbl@ldfinit{%
1090   \let\bbl@screset\@empty

## 4.5 Shorthands

**\bbl@add@special** The macro `\bbl@add@special` is used to add a new character (or single character control sequence) to the macro `\dospecials` (and `\@sanitize` if  $\LaTeX$  is used). It is used only at one place, namely when `\initiate@active@char` is called (which is ignored if the char has been made active before). Because `\@sanitize` can be undefined, we put the definition inside a conditional. Items are added to the lists without checking its existence or the original catcode. It does not hurt, but should be fixed. It's already done with `\nfss@catcodes`, added in 3.10.

```

1190 \bbl@trace{Shorhands}
1191 \def\bbl@add@special#1{% 1:a macro like \", \?, etc.
1192   \bbl@add\dospecials{\do#1}% test @sanitize = \relax, for back. compat.
1193   \bbl@ifunset{@sanitize}{\bbl@add\@sanitize{\@makeother#1}}%
1194   \ifx\nfss@catcodes\undefined\else % TODO - same for above
1195     \begingroup
1196       \catcode`#1\active
1197       \nfss@catcodes
1198       \ifnum\catcode`#1=\active
1199         \endgroup
1200         \bbl@add\nfss@catcodes{\@makeother#1}%
1201       \else
1202         \endgroup
1203       \fi
1204 \fi}

```

**\bbl@remove@special** The companion of the former macro is `\bbl@remove@special`. It removes a character from the set macros `\dospecials` and `\@sanitize`, but it is not used at all in the babel core.

```

1205 \def\bbl@remove@special#1{%
1206   \begingroup
1207   \def\x##1##2{\ifnum`#1=``##2\noexpand\@empty

1214       \def\noexpand\@sanitize{\@sanitize}%
1215     \fi}%
1216   \x}

```

**\initiate@active@char** A language definition file can call this macro to make a character active. This macro takes one argument, the character that is to be made active. When the character was already active this macro does nothing. Otherwise, this macro defines the control sequence `\normal@char<char>` to expand to the character in its ‘normal state’ and it defines the active character to expand to `\normal@char<char>` by default (`<char>` being the character to be made active). Later its definition can be changed to expand to `\active@char<char>` by calling `\bbl@activate{<char>}`. For example, to make the double quote character active one could have `\initiate@active@char{"}` in a language definition file. This defines `"` as `\active@prefix "\active@char` (where the first `"` is the character with its original catcode, when the shorthand is created, and `\active@char` is a single token). In protected contexts, it expands to `\protect "` or `\noexpand "` (ie, with the original `"`); otherwise `\active@char` is executed. This macro in turn expands to `\normal@char` in “safe” contexts (eg, `\label`), but `\user@active` in normal “unsafe” ones. The latter search a definition in the user, language and system levels, in this order, but if none is found, `\normal@char` is used. However, a deactivated shorthand (with `\bbl@deactivate` is defined as `\active@prefix "\normal@char`).

The following macro is used to define shorthands in the three levels. It takes 4 arguments: the (string'ed) character, `\<level>@group`, `<level>@active` and `<next-level>@active` (except in system).

```

1217 \def\bbl@active@def#1#2#3#4{%

```

```

1218 \namedef{#3#1}{%
1219 \expandafter\ifx\csname#2@sh@#1@endcsname\relax
1220 \bbl@afterelse\bbl@sh@select#2#1{#3@arg#1}{#4#1}%
1221 \else
1222 \bbl@afterfi\csname#2@sh@#1@endcsname
1223 \fi}%

```

When there is also no current-level shorthand with an argument we will check whether there is a next-level defined shorthand for this active character.

```

1224 \long\@namedef{#3@arg#1}##1{%
1225 \expandafter\ifx\csname#2@sh@#1\string##1@endcsname\relax
1226 \bbl@afterelse\csname#4#1\endcsname##1%
1227 \else
1228 \bbl@afterfi\csname#2@sh@#1\string##1\endcsname
1229 \fi}}%

```

\initiate@active@char calls \@initiate@active@char with 3 arguments. All of them are the same character with different catcodes: active, other (\string'ed) and the original one. This trick simplifies the code a lot.

```

1230 \def\initiate@active@char#1{%
1231 \bbl@ifunset{active@char\string#1}%
1232 {\bbl@withactive
1233 {\expandafter\@initiate@active@char\expandafter}#1\string#1#1}%
1234 {}}

```

The very first thing to do is saving the original catcode and the original definition, even if not active, which is possible (undefined characters require a special treatment to avoid making them \relax and preserving some degree of protection).

```

1235 \def\@initiate@active@char#1#2#3{%
1236 \bbl@csarg\edef\oricat@#2}{\catcode`#2=\the\catcode`#2\relax}%
1237 \ifx#1\@undefined
1238 \bbl@csarg\def\oridef@#2}{\def#1{\active@prefix#1\@undefined}}%
1239 \else
1240 \bbl@csarg\let\oridef@@#2#1%
1241 \bbl@csarg\edef\oridef@#2}{%
1242 \let\noexpand#1%
1243 \expandafter\noexpand\csname bbl@oridef@@#2\endcsname}%
1244 \fi

```

If the character is already active we provide the default expansion under this shorthand mechanism. Otherwise we write a message in the transcript file, and define \normal@char<char> to expand to the character in its default state. If the character is mathematically active when babel is loaded (for example ') the normal expansion is somewhat different to avoid an infinite loop (but it does not prevent the loop if the mathcode is set to "8000 *a posteriori*").

```

1245 \ifx#1#3\relax
1246 \expandafter\let\csname normal@char#2\endcsname#3%
1247 \else
1248 \bbl@info{Making #2 an active character}%
1249 \ifnum\mathcode`#2=\ifodd\bbl@engine"1000000 \else"8000 \fi
1250 \namedef{normal@char#2}{%
1251 \textormath{#3}{\csname bbl@oridef@@#2\endcsname}}%
1252 \else
1253 \namedef{normal@char#2}{#3}%
1254 \fi

```

To prevent problems with the loading of other packages after babel we reset the catcode of the character to the original one at the end of the package and of each language file (except with KeepShorthandsActive). It is re-activate again at \begin{document}. We also need to make sure that the shorthands are active during the processing of the .aux file. Otherwise some citations may give unexpected results in the printout when a shorthand was used in the optional argument of \bibitem for example. Then we make it active (not strictly necessary, but done for backward compatibility).

```

1255 \bbl@restoreactive{#2}%
1256 \AtBeginDocument{%
1257 \catcode`#2\active

```

```

1258      \if@filesw
1259        \immediate\write\@mainaux{\catcode`\string#2\active}%
1260      \fi}%
1261      \expandafter\bbledadd@special\csname#2\endcsname
1262      \catcode`\string#2\active
1263    \fi

```

Now we have set `\normal@char⟨char⟩`, we must define `\active@char⟨char⟩`, to be executed when the character is activated. We define the first level expansion of `\active@char⟨char⟩` to check the status of the `@safe@actives` flag. If it is set to true we expand to the ‘normal’ version of this character, otherwise we call `\user@active⟨char⟩` to start the search of a definition in the user, language and system levels (or eventually `normal@char⟨char⟩`).

```

1264    \let\bbledtempa\@firstoftwo
1265    \if\string^#2%
1266      \def\bbledtempa{\noexpand\textormath}%
1267    \else
1268      \ifx\bbledtempa\mathnormal\@undefined\else
1269        \let\bbledtempa\bbledmathnormal
1270      \fi
1271    \fi
1272    \expandafter\edef\csname active@char#2\endcsname{%
1273      \bbledtempa
1274        {\noexpand\if@safe@actives
1275          \noexpand\expandafter
1276          \expandafter\noexpand\csname normal@char#2\endcsname
1277          \noexpand\else
1278            \noexpand\expandafter
1279            \expandafter\noexpand\csname bbleddoactive#2\endcsname
1280            \noexpand\fi}%
1281        {\expandafter\noexpand\csname normal@char#2\endcsname}}%
1282    \bbledcsarg\edef{doactive#2}{%
1283      \expandafter\noexpand\csname user@active#2\endcsname}%

```

We now define the default values which the shorthand is set to when activated or deactivated. It is set to the deactivated form (globally), so that the character expands to

$$\backslash active@prefix \langle char \rangle \backslash normal@char \langle char \rangle$$

(where `\active@char⟨char⟩` is *one* control sequence!).

```

1284    \bbledcsarg\edef{active@#2}{%
1285      \noexpand\active@prefix\noexpand#1%
1286      \expandafter\noexpand\csname active@char#2\endcsname}%
1287    \bbledcsarg\edef{normal@#2}{%
1288      \noexpand\active@prefix\noexpand#1%
1289      \expandafter\noexpand\csname normal@char#2\endcsname}%
1290    \bbledncarg\let#1{\bblednormal@#2}%

```

The next level of the code checks whether a user has defined a shorthand for himself with this character. First we check for a single character shorthand. If that doesn’t exist we check for a shorthand with an argument.

```

1291    \bbledactive@def#2\user@group{user@active}{language@active}%
1292    \bbledactive@def#2\language@group{language@active}{system@active}%
1293    \bbledactive@def#2\system@group{system@active}{normal@char}%

```

In order to do the right thing when a shorthand with an argument is used by itself at the end of the line we provide a definition for the case of an empty argument. For that case we let the shorthand character expand to its non-active self. Also, When a shorthand combination such as ‘ ’ ends up in a heading  $\TeX$  would see `\protect'\protect'`. To prevent this from happening a couple of shorthand needs to be defined at user level.

```

1294    \expandafter\edef\csname\user@group @sh#2@@\endcsname
1295      {\expandafter\noexpand\csname normal@char#2\endcsname}%
1296    \expandafter\edef\csname\user@group @sh#2@\string\protect\endcsname
1297      {\expandafter\noexpand\csname user@active#2\endcsname}%

```

Finally, a couple of special cases are taken care of. (1) If we are making the right quote (') active we need to change `\prim@s` as well. Also, make sure that a single ' in math mode 'does the right thing'. (2) If we are using the caret (^) as a shorthand character special care should be taken to make sure math still works. Therefore an extra level of expansion is introduced with a check for math mode on the upper level.

```
1298 \if\string'#2%
1299 \let\prim@s\bbl@prim@s
1300 \let\active@math@prime#1%
1301 \fi
1302 \bbl@usehooks{initiateactive}{{#1}{#2}{#3}}
```

The following package options control the behavior of shorthands in math mode.

```
1303 << *More package options >> ≡
1304 \DeclareOption{math=active}{}
1305 \DeclareOption{math=normal}{\def\bbl@mathnormal{\noexpand\textormath}}
1306 << /More package options >>
```

Initiating a shorthand makes active the char. That is not strictly necessary but it is still done for backward compatibility. So we need to restore the original catcode at the end of package *and* the end of the *ldf*.

```
1307 \ifpackagewith{babel}{KeepShorthandsActive}%
1308 {\let\bbl@restoreactive\@gobble}%
1309 {\def\bbl@restoreactive#1{%
1310 \bbl@exp{%
1311 \\\AfterBabelLanguage\\CurrentOption
1312 {\catcode`#1=\the\catcode`#1\relax}%
1313 \\\AtEndOfPackage
1314 {\catcode`#1=\the\catcode`#1\relax}}}%
1315 \AtEndOfPackage{\let\bbl@restoreactive\@gobble}}
```

**\bbl@sh@select** This command helps the shorthand supporting macros to select how to proceed. Note that this macro needs to be expandable as do all the shorthand macros in order for them to work in expansion-only environments such as the argument of `\hyphenation`. This macro expects the name of a group of shorthands in its first argument and a shorthand character in its second argument. It will expand to either `\bbl@firstcs` or `\bbl@scndcs`. Hence two more arguments need to follow it.

```
1316 \def\bbl@sh@select#1#2{%
1317 \expandafter\ifx\csname#1@sh@#2@sel\endcsname\relax
1318 \bbl@afterelse\bbl@scndcs
1319 \else
1320 \bbl@afterfi\csname#1@sh@#2@sel\endcsname
1321 \fi}
```

**\active@prefix** The command `\active@prefix` which is used in the expansion of active characters has a function similar to `\OT1-cmd` in that it `\protects` the active character whenever `\protect` is *not* `\typeset@protect`. The `\@gobble` is needed to remove a token such as `\activechar`: (when the double colon was the active character to be dealt with). There are two definitions, depending of `\ifincsname` is available. If there is, the expansion will be more robust.

```
1322 \begingroup
1323 \bbl@ifunset{ifincsname}%%^A Ugly. Correct? Only Plain?
1324 {\gdef\active@prefix#1{%
1325 \ifx\protect\@typeset@protect
1326 \else
1327 \ifx\protect\@unexpandable@protect

1338    \else
1339      \ifx\protect\@typeset@protect
1340      \else
1341        \ifx\protect\@unexpandable@protect
1342          \noexpand#1%
1343        \else
1344          \protect#1%
1345        \fi
1346      \expandafter\expandafter\expandafter\@gobble
1347    \fi
1348  \fi}}
1349 \endgroup

```

**if@safe@actives** In some circumstances it is necessary to be able to reset the shorthand to its ‘normal’ value (usually the character with catcode ‘other’) on the fly. For this purpose the switch @safe@actives is available. The setting of this switch should be checked in the first level expansion of \active@char⟨char⟩. When this expansion mode is active (with \@safe@activetrue), something like "₁₃"₁₃ becomes "₁₂"₁₂ in an \edef (in other words, shorthands are \string’ed). This contrasts with \protected@edef, where catcodes are always left unchanged. Once converted, they can be used safely even after this expansion mode is deactivated (with \@safe@activefalse).

```

1350 \newif\if@safe@actives
1351 \@safe@activesfalse

```

**\bbl@restore@actives** When the output routine kicks in while the active characters were made “safe” this must be undone in the headers to prevent unexpected typeset results. For this situation we define a command to make them “unsafe” again.

```

1352 \def\bbl@restore@actives{\if@safe@actives\@safe@activesfalse\fi}

```

### **\bbl@activate**

**\bbl@deactivate** Both macros take one argument, like \initiate@active@char. The macro is used to change the definition of an active character to expand to \active@char⟨char⟩ in the case of \bbl@activate, or \normal@char⟨char⟩ in the case of \bbl@deactivate.

```

1353 \chardef\bbl@activated\z@
1354 \def\bbl@activate#1{%
1355   \chardef\bbl@activated\@ne
1356   \bbl@withactive{\expandafter\let\expandafter}#1%
1357   \csname bbl@active@\string#1\endcsname}
1358 \def\bbl@deactivate#1{%
1359   \chardef\bbl@activated\tw@
1360   \bbl@withactive{\expandafter\let\expandafter}#1%
1361   \csname bbl@normal@\string#1\endcsname}

```

### **\bbl@firstcs**

**\bbl@scndcs** These macros are used only as a trick when declaring shorthands.

```

1362 \def\bbl@firstcs#1#2{\csname#1\endcsname}
1363 \def\bbl@scndcs#1#2{\csname#2\endcsname}

```

**\declare@shorthand** The command \declare@shorthand is used to declare a shorthand on a certain level. It takes three arguments:

1. a name for the collection of shorthands, i.e. ‘system’, or ‘dutch’;
2. the character (sequence) that makes up the shorthand, i.e. ~ or "a;
3. the code to be executed when the shorthand is encountered.

The auxiliary macro `\babel@texpdf` improves the interoperativity with `hyperref` and takes 4 arguments: (1) The  $\TeX$  code in text mode, (2) the string for `hyperref`, (3) the  $\TeX$  code in math mode, and (4), which is currently ignored, but it's meant for a string in math mode, like a minus sign instead of an hyphen (currently `hyperref` doesn't discriminate the mode). This macro may be used in `ldf` files.

```

1364 \def\babel@texpdf#1#2#3#4{%
1365   \ifx\texorpdfstring\undefined
1366     \textormath{#1}{#3}%
1367   \else
1368     \texorpdfstring{\textormath{#1}{#3}}{#2}%
1369   % \texorpdfstring{\textormath{#1}{#3}}{\textormath{#2}{#4}}%
1370   \fi}
1371 %
1372 \def\declare@shorthand#1#2{\@decl@short{#1}#2\@nil}
1373 \def\@decl@short#1#2#3\@nil#4{%
1374   \def\bbl@tempa{#3}%

1394         in language \CurrentOption}%
1395      \fi}%
1396     \@namedef{#1@sh@\string#2@\string#3@}{#4}%
1397   \fi}

```

**`\textormath`** Some of the shorthands that will be declared by the language definition files have to be usable in both text and mathmode. To achieve this the helper macro `\textormath` is provided.

```

1398 \def\textormath{%
1399   \ifmmode
1400     \expandafter\@secondoftwo
1401   \else
1402     \expandafter\@firstoftwo
1403   \fi}

```

**`\user@group`**

**`\language@group`**

**`\system@group`** The current concept of ‘shorthands’ supports three levels or groups of shorthands. For each level the name of the level or group is stored in a macro. The default is to have a user group; use language group ‘english’ and have a system group called ‘system’.

```

1404 \def\user@group{user}
1405 \def\language@group{english} %^^A I don't like defaults
1406 \def\system@group{system}

```

**\usesshorthands** This is the user level macro. It initializes and activates the character for use as a shorthand character (ie, it's active in the preamble). Languages can deactivate shorthands, so a starred version is also provided which activates them always after the language has been switched.

```

1407 \def\usesshorthands{%
1408   \ifstar\bb@usesesh@s{\bb@usesesh@x{}}
1409 \def\bb@usesesh@s#1{%
1410   \bb@usesesh@x
1411   {\AddBabelHook{babel-sh-\string#1}{afterextras}{\bb@activate{#1}}}%
1412   {#1}}
1413 \def\bb@usesesh@x#1#2{%
1414   \bb@ifshorthand{#2}%
1415   {\def\user@group{user}%
1416     \initiate@active@char{#2}%
1417     #1%
1418     \bb@activate{#2}}%
1419   {\bb@error{shorthand-is-off}{#2}{}}}
```

**\defineshorthand** Currently we only support two groups of user level shorthands, named internally user and user@(<language>) (language-dependent user shorthands). By default, only the first one is taken into account, but if the former is also used (in the optional argument of \defineshorthand) a new level is inserted for it (user@generic, done by \bb@set@user@generic); we make also sure {} and \protect are taken into account in this new top level.

```

1420 \def\user@language@group{user@\language@group}
1421 \def\bb@set@user@generic#1#2{%
1422   \bb@ifunset{user@generic@active#1}%
1423   {\bb@active@def#1\user@language@group{user@active}{user@generic@active}%
1424     \bb@active@def#1\user@group{user@generic@active}{\language@active}%
1425     \expandafter\edef\csname#2@sh@#1@\endcsname{%
1426       \expandafter\noexpand\csname normal@char#1\endcsname}%
1427     \expandafter\edef\csname#2@sh@#1@\string\protect\endcsname{%
1428       \expandafter\noexpand\csname user@active#1\endcsname}}%
1429   \@empty}
1430 \newcommand\defineshorthand[3][user]{%
1431   \edef\bb@tempa{\zap@space#1 \@empty}%
1432   \bb@for\bb@tempb\bb@tempa{%
1433     \if*\expandafter\@car\bb@tempb\@nil
1434       \edef\bb@tempb{user@\expandafter\@gobble\bb@tempb}%
1435       \@expandtwoargs
1436       \bb@set@user@generic{\expandafter\string\@car#2\@nil}\bb@tempb
1437     \fi
1438     \declare@shorthand{\bb@tempb}{#2}{#3}}}
```

**\languageshorthands** A user level command to change the language from which shorthands are used. Unfortunately, babel currently does not keep track of defined groups, and therefore there is no way to catch a possible change in casing to fix it in the same way languages names are fixed.

```

1439 \def\languageshorthands#1{\def\language@group{#1}}
```

**\aliasshorthand** *Deprecated.* First the new shorthand needs to be initialized. Then, we define the new shorthand in terms of the original one, but note with \aliasshorthands{"}{/} is \active@prefix / \active@char/, so we still need to let the latter to \active@char".

```

1440 \def\aliasshorthand#1#2{%
1441   \bb@ifshorthand{#2}%
1442   {\expandafter\ifx\csname active@char\string#2\endcsname\relax

1450     \fi}
```

```

1451     \fi}%
1452     {\bbl@error{shorthand-is-off}}{#2}{}}

```

### **\@notshorthand**

```

1453 \def\@notshorthand#1{\bbl@error{not-a-shorthand}{#1}{}}

```

### **\shorthandon**

**\shorthandoff** The first level definition of these macros just passes the argument on to `\bbl@switch@sh`, adding `\@nil` at the end to denote the end of the list of characters.

```

1454 \newcommand*\shorthandon[1]{\bbl@switch@sh\@ne#1\@nnil}
1455 \DeclareRobustCommand*\shorthandoff{%
1456   \@ifstar{\bbl@shorthandoff\tw@}{\bbl@shorthandoff\z@}}
1457 \def\bbl@shorthandoff#1#2{\bbl@switch@sh#1#2\@nnil}

```

**\bbl@switch@sh** The macro `\bbl@switch@sh` takes the list of characters apart one by one and subsequently switches the category code of the shorthand character according to the first argument of `\bbl@switch@sh`.

But before any of this switching takes place we make sure that the character we are dealing with is known as a shorthand character. If it is, a macro such as `\active@char` should exist.

Switching off and on is easy – we just set the category code to ‘other’ (12) and `\active`. With the starred version, the original catcode and the original definition, saved in `@initiate@active@char`, are restored.

```

1458 \def\bbl@switch@sh#1#2{%
1459   \ifx#2\@nnil\else
1460     \bbl@ifunset{\bbl@active@\string#2}%
1461     {\bbl@error{not-a-shorthand-b}}{#2}{}}%
1462     {\ifcase#1    off, on, off*
1463       \catcode`#2\relax
1464       \or

```

1511 \newcommand\ifbabelshorthand[3]{\bb@ifunset{bb@active@\string#1}{#3}{#2}}

```

### **\bb@prim@s**

**\bb@pr@m@s** One of the internal macros that are involved in substituting `\prime` for each right quote in mathmode is `\prim@s`. This checks if the next character is a right quote. When the right quote is active, the definition of this macro needs to be adapted to look also for an active right quote; the hat could be active, too.

```

1512 \def\bb@prim@s{%
1513 \prime\futurelet\@let@token\bb@pr@m@s}
1514 \def\bb@if@primes#1#2{%

1527 \bb@if@primes" '%
1528 \pr@@s
1529 {\bb@if@primes*\^pr@@et\egroup}}
1530 \endgroup

```

Usually the `~` is active and expands to `\penalty\@M\_{}`. When it is written to the `.aux` file it is written expanded. To prevent that and to be able to use the character `~` as a start character for a shorthand, it is redefined here as a one character shorthand on system level. The system declaration is in most cases redundant (when `~` is still a non-break space), and in some cases is inconvenient (if `~` has been redefined); however, for backward compatibility it is maintained (some existing documents may rely on the babel value).

```

1531 \initiate@active@char{~}
1532 \declare@shorthand{system}{~}{\leavevmode\nobreak\ }
1533 \bb@activate{~}

```

### **\OT1dqpos**

**\Tldqpos** The position of the double quote character is different for the OT1 and T1 encodings. It will later be selected using the \f@encoding macro. Therefore we define two macros here to store the position of the character in these encodings.

```
1534 \expandafter\def\csname OTldqpos\endcsname{127}
1535 \expandafter\def\csname Tldqpos\endcsname{4}
```

When the macro \f@encoding is undefined (as it is in plain T<sub>E</sub>X) we define it here to expand to OT1

```
1536 \ifx\f@encoding\undefined
1537   \def\f@encoding{OT1}
1538 \fi
```

## 4.6 Language attributes

Language attributes provide a means to give the user control over which features of the language definition files he wants to enable.

**\languageattribute** The macro \languageattribute checks whether its arguments are valid and then activates the selected language attribute. First check whether the language is known, and then process each attribute in the list.

```
1539 \bbl@trace{Language attributes}
1540 \newcommand\languageattribute[2]{%
1541   \def\bbl@tempc{#1}%
1542   \bbl@fixname\bbl@tempc
1543   \bbl@iflanguage\bbl@tempc{%
1544     \bbl@vforeach{#2}{%
```

To make sure each attribute is selected only once, we store the already selected attributes in \bbl@known@attrs. When that control sequence is not yet defined this attribute is certainly not selected before.

```
1545     \ifx\bbl@known@attrs\undefined
1546       \in@false
1547     \else
1548       \bbl@xin@{,\bbl@tempc-##1,}{,\bbl@known@attrs,}%
1549     \fi
1550     \ifin@
1551       \bbl@warning{%
1552         You have more than once selected the attribute '##1'\%
1553         for language #1. Reported}%
1554     \else
```

When we end up here the attribute is not selected before. So, we add it to the list of selected attributes and execute the associated T<sub>E</sub>X-code.

```
1555       \bbl@exp{%
1556         \\bbl@add@list\\bbl@known@attrs{\bbl@tempc-##1}}%
1557       \edef\bbl@tempa{\bbl@tempc-##1}%
1558       \expandafter\bbl@ifknown@trib\expandafter{\bbl@tempa}\bbl@attributes%
1559       {\csname\bbl@tempc @attr##1\endcsname}%
1560       {\@attrerr{\bbl@tempc}{##1}}%
1561     \fi}}
1562 \@onlypreamble\languageattribute
```

The error text to be issued when an unknown attribute is selected.

```
1563 \newcommand*{\@attrerr}[2]{%
1564   \bbl@error{unknown-attribute}{#1}{#2}{}}
```

**\bbl@declare@ttribute** This command adds the new language/attribute combination to the list of known attributes.

Then it defines a control sequence to be executed when the attribute is used in a document. The result of this should be that the macro \extras... for the current language is extended, otherwise the attribute will not work as its code is removed from memory at \begin{document}.

```
1565 \def\bbl@declare@ttribute#1#2#3{%
1566   \bbl@xin@{,#2,}{,\BabelModifiers,}%
```

```

1567 \ifin@

1598 \def\bbl@clear@ttrib#1-#2.{%
1599   \expandafter\let\csname#1@attr@#2\endcsname\undefined}
1600 \AtBeginDocument{\bbl@clear@ttribs}

```

## 4.7 Support for saving macro definitions

To save the meaning of control sequences using `\babel@save`, we use temporary control sequences. To save hash table entries for these control sequences, we don't use the name of the control sequence to be saved to construct the temporary name. Instead we simply use the value of a counter, which is reset to zero each time we begin to save new values. This works well because we release the saved meanings before we begin to save a new set of control sequence meanings (see `\selectlanguage` and `\originalTeX`). Note undefined macros are not undefined any more when saved – they are `\relax`'ed.

**\babel@savecnt**

**\babel@beginsave** The initialization of a new save cycle: reset the counter to zero.

```
1601 \bbl@trace{Macros for saving definitions}
1602 \def\babel@beginsave{\babel@savecnt\z@}
```

Before it's forgotten, allocate the counter and initialize all.

```
1603 \newcount\babel@savecnt
1604 \babel@beginsave
```

## **\babel@save**

**\babel@savevariable** The macro `\babel@save{<cname>}` saves the current meaning of the control sequence `<cname>` to `\originalTeX`<sup>2</sup>. To do this, we let the current meaning to a temporary control sequence, the restore commands are appended to `\originalTeX` and the counter is incremented. The macro `\babel@savevariable{<variable>}` saves the value of the variable. `<variable>` can be anything allowed after the `\the` primitive. To avoid messing saved definitions up, they are saved only the very first time.

```
1605 \def\babel@save#1{%
1606   \def\bbl@tempa{,{#1,}}% Clumsy, for Plain
1607   \expandafter\bbl@add\expandafter\bbl@tempa\expandafter{%
1608     \expandafter{\expandafter,\bbl@savextras,}}%

1616     \advance\babel@savecnt@ne
1617   \fi}
1618 \def\babel@savevariable#1{%
1619   \toks@\expandafter{\originalTeX #1=}%
1620   \bbl@exp{\def\\originalTeX{\the\toks@the#1\relax}}}
```

## **\bbl@frenchspacing**

**\bbl@nonfrenchspacing** Some languages need to have `\frenchspacing` in effect. Others don't want that. The command `\bbl@frenchspacing` switches it on when it isn't already in effect and `\bbl@nonfrenchspacing` switches it off if necessary. A more refined way to switch the catcodes is done with ini files. Here an auxiliary macro is defined, but the main part is in `\babelprovide`. This new method should be ideally the default one.

```
1621 \def\bbl@frenchspacing{%
1622   \ifnum\the\sfcode`\.=@m
1623     \let\bbl@nonfrenchspacing\relax
1624   \else
1625     \frenchspacing
1626     \let\bbl@nonfrenchspacing\nonfrenchspacing
1627   \fi}

1693 \bbl@ifunset\bbl@hyphenation@\bbl@tempa}%
1694 }%
1695 {\csname bbl@hyphenation@\bbl@tempa\endcsname\space}%
1696 #2}}%
1697 \fi}}

```

**\babelhyphenmins** Only L<sup>A</sup>T<sub>E</sub>X (basically because it's defined with a L<sup>A</sup>T<sub>E</sub>X tool).

```

1698 \ifx\NewDocumentCommand\@undefined\else
1699 \NewDocumentCommand\babelhyphenmins{sommo}{%
1700 \IfNoValueTF{#2}%
1701 {\protected@edef\bbl@hyphenmins@\set@hyphenmins{#3}{#4}}%
1702 \IfValueT{#5}{%
1703 \protected@edef\bbl@hyphenatmin@\hyphenationmin=#5\relax}}%
1704 \IfBooleanT{#1}{%
1705 \lefthyphenmin=#3\relax
1706 \righthyphenmin=#4\relax
1707 \IfValueT{#5}{\hyphenationmin=#5\relax}}}%
1708 {\edef\bbl@tempb{\zap@space#2 \@empty}%
1709 \bbl@for\bbl@tempa\bbl@tempb{%
1710 \@namedef\bbl@hyphenmins@\bbl@tempa}{\set@hyphenmins{#3}{#4}}%
1711 \IfValueT{#5}{%
1712 \@namedef\bbl@hyphenatmin@\bbl@tempa}{\hyphenationmin=#5\relax}}}%
1713 \IfBooleanT{#1}{\bbl@error{hyphenmins-args}{}}{}}%
1714 \fi

```

**\bbl@allowhyphens** This macro makes hyphenation possible. Basically its definition is nothing more than `\nobreak\hskip0pt plus 0pt`<sup>3</sup>.

```

1715 \def\bbl@allowhyphens{\ifvmode\else\nobreak\hskip\z@skip\fi}
1716 \def\bbl@t@one{T1}
1717 \def\allowhyphens{\ifx\cf@encoding\bbl@t@one\else\bbl@allowhyphens\fi}

```

**\babelhyphen** Macros to insert common hyphens. Note the space before @ in `\babelhyphen`. Instead of protecting it with `\DeclareRobustCommand`, which could insert a `\relax`, we use the same procedure as shorthands, with `\active@` prefix.

```

1718 \newcommand\babellnullhyphen{\char\hyphenchar\font}
1719 \def\babelhyphen{\active@prefix\babelhyphen\bbl@hyphen}
1720 \def\bbl@hyphen{%
1721 \@ifstar{\bbl@hyphen@i @}{\bbl@hyphen@i\@empty}}
1722 \def\bbl@hyphen@i#1#2{%
1723 \bbl@ifunset\bbl@hy@#1#2\@empty}%
1724 {\csname bbl@#1usehyphen\endcsname{\discretionary{#2}{}{#2}}}%
1725 {\csname bbl@hy@#1#2\@empty\endcsname}}

```

The following two commands are used to wrap the “hyphen” and set the behavior of the rest of the word – the version with a single @ is used when further hyphenation is allowed, while that with @@ if no more hyphens are allowed. In both cases, if the hyphen is preceded by a positive space, breaking after the hyphen is disallowed.

There should not be a discretionary after a hyphen at the beginning of a word, so it is prevented if preceded by a skip. Unfortunately, this does handle cases like “(-suffix)”. `\nobreak` is always preceded by `\leavevmode`, in case the shorthand starts a paragraph.

```

1726 \def\bbl@usehyphen#1{%
1727 \leavevmode
1728 \ifdim\lastskip>\z@\mbox{#1}\else\nobreak#1\fi
1729 \nobreak\hskip\z@skip}
1730 \def\bbl@@usehyphen#1{%
1731 \leavevmode\ifdim\lastskip>\z@\mbox{#1}\else#1\fi}

```

<sup>3</sup>L<sup>A</sup>T<sub>E</sub>X begins and ends a word for hyphenation at a glue node. The penalty prevents a linebreak at this glue node.

The following macro inserts the hyphen char:

```
1732 \def\bbl@hyphenchar{%
1733   \ifnum\hyphenchar\font=\m@ne
1734     \babe\nullhyphen
1735   \else
1736     \char\hyphenchar\font
1737   \fi}
```

Finally, we define the hyphen “types”. Their names will not change, so you may use them in ldf’s. After a space, the `\mbox` in `\bbl@hy@nobreak` is redundant.

```
1738 \def\bbl@hy@soft{\bbl@usehyphen{\discretionary{\bbl@hyphenchar}{}}{}}
1739 \def\bbl@hy@soft{\bbl@usehyphen{\discretionary{\bbl@hyphenchar}{}}{}}
1740 \def\bbl@hy@hard{\bbl@usehyphen\bbl@hyphenchar}
1741 \def\bbl@hy@hard{\bbl@usehyphen\bbl@hyphenchar}
1742 \def\bbl@hy@nobreak{\bbl@usehyphen{\mbox{\bbl@hyphenchar}}}
1743 \def\bbl@hy@nobreak{\mbox{\bbl@hyphenchar}}
1744 \def\bbl@hy@repeat{%
1745   \bbl@usehyphen{%
1746     \discretionary{\bbl@hyphenchar}{\bbl@hyphenchar}{\bbl@hyphenchar}}}
1747 \def\bbl@hy@repeat{%
1748   \bbl@usehyphen{%
1749     \discretionary{\bbl@hyphenchar}{\bbl@hyphenchar}{\bbl@hyphenchar}}}
1750 \def\bbl@hy@empty{\hskip\z@skip}
1751 \def\bbl@hy@empty{\discretionary{}{}{}}
```

**\bbl@disc** For some languages the macro `\bbl@disc` is used to ease the insertion of discretionaries for letters that behave ‘abnormally’ at a breakpoint.

```
1752 \def\bbl@disc#1#2{\nobreak\discretionary{#2-}{#1}\bbl@allowhyphens}
```

## 4.10 Multiencoding strings

The aim following commands is to provide a common interface for strings in several encodings. They also contains several hooks which can be used by `luatex` and `xetex`. The code is organized here with pseudo-guards, so we start with the basic commands.

**Tools** But first, a tool. It makes global a local variable. This is not the best solution, but it works.

```
1753 \bbl@trace{Multiencoding strings}
1754 \def\bbl@tglobal#1{\global\let#1#1}
```

The following option is currently no-op. It was meant for the deprecated `\SetCase`.

```
1755 <<{*More package options}>> ≡
1756 \DeclareOption{nocase}{}
1757 <</More package options>>
```

The following package options control the behavior of `\SetString`.

```
1758 <<{*More package options}>> ≡
1759 \let\bbl@opt@strings\@nnil % accept strings=value
1760 \DeclareOption{strings}{\def\bbl@opt@strings{\BabelStringsDefault}}
1761 \DeclareOption{strings=encoded}{\let\bbl@opt@strings\relax}
1762 \def\BabelStringsDefault{generic}
1763 <</More package options>>
```

**Main command** This is the main command. With the first use it is redefined to omit the basic setup in subsequent blocks. We make sure strings contain actual letters in the range 128-255, not active characters.

```

Parse the encoding info to get the label, input, and font parts.

Select the behavior of \SetString. There are two main cases, depending of if there is an optional argument: without it and strings=encoded, strings are defined always; otherwise, they are set only if they are still undefined (ie, fallback values). With labelled blocks and strings=encoded, define the strings, but with another value, define strings only if the current label or font encoding is the value of strings; otherwise (ie, no strings or a block whose label is not in strings=) do nothing.

We presume the current block is not loaded, and therefore set (above) a couple of default values to gobble the arguments. Then, these macros are redefined if necessary according to several parameters.

There are two versions of `\bbbl@scswitch`. The first version is used when `ldfs` are read, and it makes sure `\langle group \rangle \langle language \rangle` is reset, but only once (`\bbbl@screset` is used to keep track of this). The second version is used in the preamble and packages loaded after `babel` and does nothing. The macro `\bbbl@forlang` loops `\bbbl@L` but its body is executed only if the value is in `\BabelLanguages` (inside `babel`) or `\date \langle language \rangle` is defined (after `babel` has been loaded). There are also two version of `\bbbl@forlang`. The first one skips the current iteration if the language is not in `\BabelLanguages` (used in `ldfs`), and the second one skips undefined languages (after `babel` has been loaded).

```

1861 \def\bbbl@forlang#1#2{%

```

Now we define commands to be used inside \StartBabelCommands.

**Strings** The following macro is the actual definition of \SetString when it is “active” First save the “switcher”. Create it if undefined. Strings are defined only if undefined (ie, like \providescommand). With the event stringprocess you can preprocess the string by manipulating the value of \BabelString. If there are several hooks assigned to this event, preprocessing is done in the same order as defined. Finally, the string is set.

```

1887 \def\bbl@setstring#1#2{% eg, \prefacename{<string>}
1888   \bbl@forlang\bbl@tempa{%
1889     \edef\bbl@LC{\bbl@tempa\bbl@stripslash#1}%
1890     \bbl@ifunset{\bbl@LC}% eg, \germanchaptername
1891     {\bbl@exp{%
1892       \global\\bbl@add\<\bbl@G\bbl@tempa>{\bbl@scset\\#1\<\bbl@LC>}}}%
1893     }%
1894   \def\BabelString{#2}%
1895   \bbl@usehooks{stringprocess}{}%
1896   \expandafter\bbl@stringdef
1897   \csname\bbl@LC\expandafter\endcsname\expandafter{\BabelString}}

```

A little auxiliary command sets the string. Formerly used with casing. Very likely no longer necessary, although it's used in \setlocalecaption.

```

1898 \def\bbl@scset#1#2{\def#1{#2}}

```

Define \SetStringLoop, which is actually set inside \StartBabelCommands. The current definition is somewhat complicated because we need a count, but \count@ is not under our control (remember \SetString may call hooks). Instead of defining a dedicated count, we just “pre-expand” its value.

```

1899 << *Macros local to BabelCommands >> ≡
1900 \def\SetStringLoop##1#2{%
1901   \def\bbl@templ####1{\expandafter\noexpand\csname##1\endcsname}%
1902   \count@\z@
1903   \bbl@loop\bbl@tempa{##2}{% empty items and spaces are ok
1904     \advance\count@\@ne
1905     \toks@\expandafter{\bbl@tempa}%
1906     \bbl@exp{%
1907       \\SetString\bbl@templ{\romannumeral\count@}{\the\toks@}%
1908       \count@=\the\count@\relax}}}%
1909 <</Macros local to BabelCommands >>

```

**Delaying code** Now the definition of \AfterBabelCommands when it is activated.

```

1910 \def\bbl@aftercmds#1{%
1911   \toks@\expandafter{\bbl@scafter#1}%
1912   \xdef\bbl@scafter{\the\toks@}}

```

**Case mapping** The command \SetCase is deprecated. Currently it consists in a definition with a hack just for backward compatibility in the macro mapping.

```

```
2028 \setbox\z@\hbox{\lower\dimen\z@ \box\z@}\ht\z@\ht\tw@ \dp\z@\dp\tw@}
```

**\save@sf@q** The macro \save@sf@q is used to save and reset the current space factor.

```
2029 \def\save@sf@q#1{\leavevmode
2030 \begingroup
2031 \edef\@SF{\spacefactor\the\spacefactor}\#1\@SF
2032 \endgroup}
```

## 4.12 Making glyphs available

This section makes a number of glyphs available that either do not exist in the OT1 encoding and have to be ‘faked’, or that are not accessible through Tlenc.def.

### 4.12.1 Quotation marks

**\quotedblbase** In the T1 encoding the opening double quote at the baseline is available as a separate character, accessible via \quotedblbase. In the OT1 encoding it is not available, therefore we make it available by lowering the normal open quote character to the baseline.

```
2033 \ProvideTextCommand{\quotedblbase}{OT1}{%
2034 \save@sf@q{\set@low@box{\textquotedblright\}}%
2035 \box\z@\kern-.04em\bbl@allowhyphens}}
```

Make sure that when an encoding other than OT1 or T1 is used this glyph can still be typeset.

```
2036 \ProvideTextCommandDefault{\quotedblbase}{%
2037 \UseTextSymbol{OT1}{\quotedblbase}}
```

**\quotesinglbase** We also need the single quote character at the baseline.

```
2038 \ProvideTextCommand{\quotesinglbase}{OT1}{%
2039 \save@sf@q{\set@low@box{\textquoteright\}}%
2040 \box\z@\kern-.04em\bbl@allowhyphens}}
```

Make sure that when an encoding other than OT1 or T1 is used this glyph can still be typeset.

```
2041 \ProvideTextCommandDefault{\quotesinglbase}{%
2042 \UseTextSymbol{OT1}{\quotesinglbase}}
```

### **\guillemetleft**

**\guillemetright** The guillemet characters are not available in OT1 encoding. They are faked. (Wrong names with o preserved for compatibility.)

```
2043 \ProvideTextCommand{\guillemetleft}{OT1}{%
2044 \ifmmode
2045 \ll
2046 \else
2047 \save@sf@q{\nobreak
2048 \raise.2ex\hbox{$\scriptscriptstyle\ll$}\bbl@allowhyphens}%
2049 \fi}
2050 \ProvideTextCommand{\guillemetright}{OT1}{%
2051 \ifmmode
2052 \gg
2053 \else
2054 \save@sf@q{\nobreak
2055 \raise.2ex\hbox{$\scriptscriptstyle\gg$}\bbl@allowhyphens}%
2056 \fi}
2057 \ProvideTextCommand{\guillemotleft}{OT1}{%
2058 \ifmmode
2059 \ll
2060 \else
2061 \save@sf@q{\nobreak
2062 \raise.2ex\hbox{$\scriptscriptstyle\ll$}\bbl@allowhyphens}%
2063 \fi}
2064 \ProvideTextCommand{\guillemotright}{OT1}{%
2065 \ifmmode
2066 \gg
2067 \else
2068 \save@sf@q{\nobreak
2069 \raise.2ex\hbox{$\scriptscriptstyle\gg$}\bbl@allowhyphens}%
2070 \fi}
```

```

2065 \ifmmode
2066   \gg
2067 \else
2068   \save@sf@q{\nobreak
2069     \raise.2ex\hbox{$\scriptscriptstyle\gg$}\bbl@allowhyphens}%
2070 \fi}

```

Make sure that when an encoding other than OT1 or T1 is used these glyphs can still be typeset.

```

2071 \ProvideTextCommandDefault{\guillemetleft}{%
2072   \UseTextSymbol{OT1}{\guillemetleft}}
2073 \ProvideTextCommandDefault{\guillemetright}{%
2074   \UseTextSymbol{OT1}{\guillemetright}}
2075 \ProvideTextCommandDefault{\guillemotleft}{%
2076   \UseTextSymbol{OT1}{\guillemotleft}}
2077 \ProvideTextCommandDefault{\guillemotright}{%
2078   \UseTextSymbol{OT1}{\guillemotright}}

```

### **\guilsinglleft**

**\guilsinglright** The single guillemets are not available in OT1 encoding. They are faked.

```

2079 \ProvideTextCommand{\guilsinglleft}{OT1}{%
2080   \ifmmode
2081     <%
2082   \else
2083     \save@sf@q{\nobreak
2084       \raise.2ex\hbox{$\scriptscriptstyle<$}\bbl@allowhyphens}%
2085   \fi}
2086 \ProvideTextCommand{\guilsinglright}{OT1}{%
2087   \ifmmode
2088     >%
2089   \else
2090     \save@sf@q{\nobreak
2091       \raise.2ex\hbox{$\scriptscriptstyle>$}\bbl@allowhyphens}%
2092   \fi}

```

Make sure that when an encoding other than OT1 or T1 is used these glyphs can still be typeset.

```

2093 \ProvideTextCommandDefault{\guilsinglleft}{%
2094   \UseTextSymbol{OT1}{\guilsinglleft}}
2095 \ProvideTextCommandDefault{\guilsinglright}{%
2096   \UseTextSymbol{OT1}{\guilsinglright}}

```

## **4.12.2 Letters**

### **\ij**

**\IJ** The dutch language uses the letter ‘ij’. It is available in T1 encoded fonts, but not in the OT1 encoded fonts. Therefore we fake it for the OT1 encoding.

```

2097 \DeclareTextCommand{\ij}{OT1}{%
2098   i\kern-0.02em\bbl@allowhyphens j}
2099 \DeclareTextCommand{\IJ}{OT1}{%
2100   I\kern-0.02em\bbl@allowhyphens J}
2101 \DeclareTextCommand{\ij}{T1}{\char188}
2102 \DeclareTextCommand{\IJ}{T1}{\char156}

```

Make sure that when an encoding other than OT1 or T1 is used these glyphs can still be typeset.

```

2103 \ProvideTextCommandDefault{\ij}{%
2104   \UseTextSymbol{OT1}{\ij}}
2105 \ProvideTextCommandDefault{\IJ}{%
2106   \UseTextSymbol{OT1}{\IJ}}

```

### **\dj**

**\DJ** The croatian language needs the letters \dj and \DJ; they are available in the T1 encoding, but not in the OT1 encoding by default. Some code to construct these glyphs for the OT1 encoding was made available to me by Stipčević Mario, (stipcevic@olimp.irb.hr).

```

2107 \def\crrtic@{\hrule height0.1ex width0.3em}
2108 \def\crttic@{\hrule height0.1ex width0.33em}
2109 \def\ddj@{%
2110   \setbox0\hbox{d}\dimen@=\ht0
2111   \advance\dimen@lex
2112   \dimen@.45\dimen@
2113   \dimen@ii\expandafter\rem@pt\the\fontdimen\@ne\font\dimen@
2114   \advance\dimen@ii.5ex
2115   \leavevmode\rlap{\raise\dimen@\hbox{\kern\dimen@ii\vbox{\crrtic@}}}}
2116 \def\DDJ@{%
2117   \setbox0\hbox{D}\dimen@=.55\ht0
2118   \dimen@ii\expandafter\rem@pt\the\fontdimen\@ne\font\dimen@
2119   \advance\dimen@ii.15ex % correction for the dash position
2120   \advance\dimen@ii-.15\fontdimen7\font % correction for cmtt font
2121   \dimen\thr@@\expandafter\rem@pt\the\fontdimen7\font\dimen@
2122   \leavevmode\rlap{\raise\dimen@\hbox{\kern\dimen@ii\vbox{\crttic@}}}}
2123 %
2124 \DeclareTextCommand{\dj}{OT1}{\ddj@ d}
2125 \DeclareTextCommand{\DJ}{OT1}{\DDJ@ D}

```

Make sure that when an encoding other than OT1 or T1 is used these glyphs can still be typeset.

```

2126 \ProvideTextCommandDefault{\dj}{%
2127   \UseTextSymbol{OT1}{\dj}}
2128 \ProvideTextCommandDefault{\DJ}{%
2129   \UseTextSymbol{OT1}{\DJ}}

```

**\SS** For the T1 encoding \SS is defined and selects a specific glyph from the font, but for other encodings it is not available. Therefore we make it available here.

```

2130 \DeclareTextCommand{\SS}{OT1}{SS}
2131 \ProvideTextCommandDefault{\SS}{\UseTextSymbol{OT1}{\SS}}

```

#### 4.12.3 Shorthands for quotation marks

Shorthands are provided for a number of different quotation marks, which make them usable both outside and inside mathmode. They are defined with \ProvideTextCommandDefault, but this is very likely not required because their definitions are based on encoding-dependent macros.

**\glq**

**\grq** The ‘german’ single quotes.

```

2132 \ProvideTextCommandDefault{\glq}{%
2133   \textormath{\quotesinglbase}{\mbox{\quotesinglbase}}}

```

The definition of \grq depends on the fontencoding. With T1 encoding no extra kerning is needed.

```

2134 \ProvideTextCommand{\grq}{T1}{%
2135   \textormath{\kern\z@\textquoteleft}{\mbox{\textquoteleft}}}
2136 \ProvideTextCommand{\grq}{TU}{%
2137   \textormath{\textquoteleft}{\mbox{\textquoteleft}}}
2138 \ProvideTextCommand{\grq}{OT1}{%
2139   \save@sf@q{\kern-.0125em
2140     \textormath{\textquoteleft}{\mbox{\textquoteleft}}}%
2141     \kern.07em\relax}}
2142 \ProvideTextCommandDefault{\grq}{\UseTextSymbol{OT1}{\grq}}

```

**\glqq**

**\grqq** The ‘german’ double quotes.

```
2143 \ProvideTextCommandDefault{\glqq}{%
2144   \textormath{\quotedblbase}{\mbox{\quotedblbase}}}
```

The definition of \grqq depends on the fontencoding. With T1 encoding no extra kerning is needed.

```
2145 \ProvideTextCommand{\grqq}{T1}{%
2146   \textormath{\textquotedblleft}{\mbox{\textquotedblleft}}}
2147 \ProvideTextCommand{\grqq}{TU}{%
2148   \textormath{\textquotedblleft}{\mbox{\textquotedblleft}}}
2149 \ProvideTextCommand{\grqq}{OT1}{%
2150   \save@sf@q{\kern-.07em
2151     \textormath{\textquotedblleft}{\mbox{\textquotedblleft}}}
2152     \kern.07em\relax}}
2153 \ProvideTextCommandDefault{\grqq}{\UseTextSymbol{OT1}\grqq}
```

**\flq**

**\frq** The ‘french’ single guillemets.

```
2154 \ProvideTextCommandDefault{\flq}{%
2155   \textormath{\guilsinglleft}{\mbox{\guilsinglleft}}}
2156 \ProvideTextCommandDefault{\frq}{%
2157   \textormath{\guilsinglright}{\mbox{\guilsinglright}}}
```

**\flqq**

**\frqq** The ‘french’ double guillemets.

```
2158 \ProvideTextCommandDefault{\flqq}{%
2159   \textormath{\guillemetleft}{\mbox{\guillemetleft}}}
2160 \ProvideTextCommandDefault{\frqq}{%
2161   \textormath{\guillemetright}{\mbox{\guillemetright}}}
```

#### 4.12.4 Umlauts and tremas

The command \ " needs to have a different effect for different languages. For German for instance, the ‘umlaut’ should be positioned lower than the default position for placing it over the letters a, o, u, A, O and U. When placed over an e, i, E or I it can retain its normal position. For Dutch the same glyph is always placed in the lower position.

**\umlauthigh**

**\umlautlow** To be able to provide both positions of \ " we provide two commands to switch the positioning, the default will be \umlauthigh (the normal positioning).

```
2162 \def\umlauthigh{%
2163   \def\bbl@umlauta##1{\leavevmode\bgroup%
2164     \accent\csname\f@encoding dqpos\endcsname
2165     ##1\bbl@allowhyphens\egroup}%
2166   \let\bbl@umlaute\bbl@umlauta}
2167 \def\umlautlow{%
2168   \def\bbl@umlauta{\protect\lower@umlaut}}
2169 \def\umlautelw{%
2170   \def\bbl@umlaute{\protect\lower@umlaut}}
2171 \umlauthigh
```

**\lower@umlaut** The command \lower@umlaut is used to position the \ " closer to the letter. We want the umlaut character lowered, nearer to the letter. To do this we need an extra *<dimen>* register.

```
2172 \expandafter\ifx\csname U@D\endcsname\relax
2173   \csname newdimen\endcsname U@D
2174 \fi
```

The following code fools  $\TeX$ 's `make_accent` procedure about the current x-height of the font to force another placement of the umlaut character. First we have to save the current x-height of the font, because we'll change this font dimension and this is always done globally.

Then we compute the new x-height in such a way that the umlaut character is lowered to the base character. The value of `.45ex` depends on the METAFONT parameters with which the fonts were built. (Just try out, which value will look best.) If the new x-height is too low, it is not changed. Finally we call the `\accent` primitive, reset the old x-height and insert the base character in the argument.

```
2175 \def\lower@umlaut#1{%
2176   \leavevmode\bgroup
2177     \U@D lex%
2178     {\setbox\z@\hbox{%
2179       \char\csname\f@encoding dqpos\endcsname}%
2180       \dimen@ -.45ex\advance\dimen@\ht\z@
2181       \ifdim lex<\dimen@ \fontdimen5\font\dimen@ \fi}%
2182     \accent\csname\f@encoding dqpos\endcsname
2183     \fontdimen5\font\U@D #1%
2184   \egroup}
```

For all vowels we declare `\` to be a composite command which uses `\bbl@umlauta` or `\bbl@umlaute` to position the umlaut character. We need to be sure that these definitions override the ones that are provided when the package `fontenc` with option `OT1` is used. Therefore these declarations are postponed until the beginning of the document. Note these definitions only apply to some languages, but `babel` sets them for *all* languages – you may want to redefine `\bbl@umlauta` and/or `\bbl@umlaute` for a language in the corresponding `ldf` (using the `babel` switching mechanism, of course).

```
2185 \AtBeginDocument{%
2186   \DeclareTextCompositeCommand{\}{OT1}{a}{\bbl@umlauta{a}}%
2187   \DeclareTextCompositeCommand{\}{OT1}{e}{\bbl@umlaute{e}}%
2188   \DeclareTextCompositeCommand{\}{OT1}{i}{\bbl@umlaute{i}}%
2189   \DeclareTextCompositeCommand{\}{OT1}{\i}{\bbl@umlaute{i}}%
2190   \DeclareTextCompositeCommand{\}{OT1}{o}{\bbl@umlauta{o}}%
2191   \DeclareTextCompositeCommand{\}{OT1}{u}{\bbl@umlauta{u}}%
2192   \DeclareTextCompositeCommand{\}{OT1}{A}{\bbl@umlauta{A}}%
2193   \DeclareTextCompositeCommand{\}{OT1}{E}{\bbl@umlaute{E}}%
2194   \DeclareTextCompositeCommand{\}{OT1}{I}{\bbl@umlaute{I}}%
2195   \DeclareTextCompositeCommand{\}{OT1}{O}{\bbl@umlauta{O}}%
2196   \DeclareTextCompositeCommand{\}{OT1}{U}{\bbl@umlauta{U}}}
```

Finally, make sure the default hyphenrules are defined (even if empty). For internal use, another empty `\language` is defined. Currently used in Amharic.

```
2197 \ifx\l@english\@undefined
2198   \chardef\l@english\z@
2199 \fi
2200 % The following is used to cancel rules in ini files (see Amharic).
2201 \ifx\l@unhyphenated\@undefined
2202   \newlanguage\l@unhyphenated
2203 \fi
```

## 4.13 Layout

Layout is mainly intended to set bidi documents, but there is at least a tool useful in general.

```
2204 \bbl@trace{Bidi layout}

```

## 4.15 Creating and modifying languages

Continue with  $\LaTeX$  only.

`\babelprovide` is a general purpose tool for creating and modifying languages. It creates the language infrastructure, and loads, if requested, an `ini` file. It may be used in conjunction to previously loaded `ldf` files.

```

2258 \end{package | core}
2259 \end{package}
2260 \bbl@trace{Creating languages and reading ini files}

```

Now, the 'main loop', which **must be executed inside a group**. At this point, \bbl@inidata may contain data declared in \babelprovide, with 'slashed' keys. There are 3 steps: first read the ini file and store it; then traverse the stored values, and process some groups if required (date, captions, labels, counters); finally, 'export' some values by defining global macros (identification, typography, characters, numbers). The second argument is 0 when called to read the minimal data for fonts; with \babelprovide it's either 1 or 2.

```

A key with a slash in \babelprovide replaces the value in the ini file (which is ignored altogether). The mechanism is simple (but suboptimal): add the data to the ini one (at this point the ini file has not yet been read), and define a dummy macro. When the ini file is read, just skip the corresponding key and reset the macro (in \bbl@inistore above).

```

Key-value pairs are treated differently depending on the section in the ini file. The following macros are the readers for identification and typography. Note `\bbl@ini@exports` is called always (via `\bbl@inisec`), while `\bbl@after@ini` must be called explicitly after `\bbl@read@ini` if necessary. Although BCP 47 doesn't treat 'x' as an extension, the CLDR and many other sources do (as a *private use extension*). For consistency with other single-letter subtags or 'singletons', here is considered an extension, too.

```

**Dates** will require some macros for the basic formatting. They may be redefined by language, so “semi-public” names (camel case) are used. Oddly enough, the CLDR places particles like “de” inconsistently in either in the date or in the month name. Note after `\bbl@replace\toks@` contains the resulting string, which is used by `\bbl@replace@finish@iii` (this implicit behavior doesn’t seem a good idea, but it’s efficient).

The code for additive counters is somewhat tricky and it's based on the fact the arguments just before @@ collects digits which have been left 'unused' in previous arguments, the first of them being the number of digits in the number to be converted. This explains the reverse set 76543210. Digits above 10000 are not handled yet. When the key contains the subkey .F., the number after is treated as an special case, for a fixed form (see babel-he.ini, for example).

## 5.1 Cross referencing macros

The  $\LaTeX$  book states:

The key argument is any sequence of letters, digits, and punctuation symbols; upper- and lowercase letters are regarded as different.

When the above quote should still be true when a document is typeset in a language that has active characters, special care has to be taken of the category codes of these characters when they appear in an argument of the cross referencing macros.

When a cross referencing command processes its argument, all tokens in this argument should be character tokens with category ‘letter’ or ‘other’.

The following package options control which macros are to be redefined.

```

3722 << *More package options >> ≡
3723 \DeclareOption{safe=none}{\let\bbl@opt@safe\@empty}
3724 \DeclareOption{safe=bib}{\def\bbl@opt@safe{B}}
3725 \DeclareOption{safe=ref}{\def\bbl@opt@safe{R}}
3726 \DeclareOption{safe=refbib}{\def\bbl@opt@safe{BR}}
3727 \DeclareOption{safe=bibref}{\def\bbl@opt@safe{BR}}
3728 << /More package options >>

```

**\@newl@bel** First we open a new group to keep the changed setting of `\protect` local and then we set the `@safe@actives` switch to true to make sure that any shorthand that appears in any of the arguments immediately expands to its non-active self.

```

3729 \bbl@trace{Cross referencing macros}
3730 \ifx\bbl@opt@safe\@empty\else % ie, if 'ref' and/or 'bib'
3731   \def\@newl@bel#1#2#3{%
3732     {\@safe@activestrue
3733       \bbl@ifunset{#1@#2}%
3734       \relax
3735       {\gdef\@multiplelabels{%
3736         \@latex@warning@no@line{There were multiply-defined labels}}}%
3737       \@latex@warning@no@line{Label `#2' multiply defined}}}%
3738   \global\@namedef{#1@#2}{#3}}

```

**\@testdef** An internal  $\TeX$  macro used to test if the labels that have been written on the .aux file have changed. It is called by the `\enddocument` macro.

```

3739 \CheckCommand*\@testdef[3]{%
3740   \def\reserved@a{#3}%
3741   \expandafter\ifx\csname#1@#2\endcsname\reserved@a
3742   \else
3743     \@tempswatrue
3744   \fi}

```

Now that we made sure that `\@testdef` still has the same definition we can rewrite it. First we make the shorthands ‘safe’. Then we use `\bbl@tempa` as an ‘alias’ for the macro that contains the label which is being checked. Then we define `\bbl@tempb` just as `\@newl@bel` does it. When the label is defined we replace the definition of `\bbl@tempa` by its meaning. If the label didn’t change, `\bbl@tempa` and `\bbl@tempb` should be identical macros.

```

3745 \def\@testdef#1#2#3{% TODO. With @samestring?
3746   \@safe@activestrue
3747   \expandafter\let\expandafter\bbl@tempa\csname #1@#2\endcsname
3748   \def\bbl@tempb{#3}%
3749   \@safe@activesfalse
3750   \ifx\bbl@tempa\relax
3751   \else
3752     \edef\bbl@tempa{\expandafter\strip@prefix\meaning\bbl@tempa}%
3753   \fi
3754   \edef\bbl@tempb{\expandafter\strip@prefix\meaning\bbl@tempb}%
3755   \ifx\bbl@tempa\bbl@tempb
3756   \else
3757     \@tempswatrue
3758   \fi}
3759 \fi

```

**\ref**

**\pageref** The same holds for the macro \ref that references a label and \pageref to reference a page. We make them robust as well (if they weren't already) to prevent problems if they should become expanded at the wrong moment.

```

3760 \bbl@xin@{R}\bbl@opt@safe
3761 \ifin@
3762 \edef\bbl@tempc{\expandafter\string\csname ref code\endcsname}%
3763 \bbl@xin@{\expandafter\strip@prefix\meaning\bbl@tempc}%
3764 {\expandafter\strip@prefix\meaning\ref}%
3765 \ifin@
3766 \bbl@redefine\@kernel@ref#1{%
3767   \@safe@activetrue\org@@kernel@ref{#1}\@safe@activestfalse}
3768 \bbl@redefine\@kernel@pageref#1{%
3769   \@safe@activetrue\org@@kernel@pageref{#1}\@safe@activestfalse}
3770 \bbl@redefine\@kernel@sref#1{%
3771   \@safe@activetrue\org@@kernel@sref{#1}\@safe@activestfalse}
3772 \bbl@redefine\@kernel@spageref#1{%
3773   \@safe@activetrue\org@@kernel@spageref{#1}\@safe@activestfalse}
3774 \else
3775 \bbl@redefineroobust\ref#1{%
3776   \@safe@activetrue\org@ref{#1}\@safe@activestfalse}
3777 \bbl@redefineroobust\pageref#1{%
3778   \@safe@activetrue\org@pageref{#1}\@safe@activestfalse}
3779 \fi
3780 \else
3781 \let\org@ref\ref
3782 \let\org@pageref\pageref
3783 \fi

```

**\@citex** The macro used to cite from a bibliography, \cite, uses an internal macro, \@citex. It is this internal macro that picks up the argument(s), so we redefine this internal macro and leave \cite alone. The first argument is used for typesetting, so the shorthands need only be deactivated in the second argument.

```

3784 \bbl@xin@{B}\bbl@opt@safe
3785 \ifin@
3786 \bbl@redefine\@citex[#1]#2{%
3787   \@safe@activetrue\edef\bbl@tempa{#2}\@safe@activestfalse
3788   \org@@citex[#1]{\bbl@tempa}}

```

Unfortunately, the packages natbib and cite need a different definition of \@citex... To begin with, natbib has a definition for \@citex with *three* arguments... We only know that a package is loaded when \begin{document} is executed, so we need to postpone the different redefinition.

```

3789 \AtBeginDocument{%
3790   \ifpackageloaded{natbib}{%

```

Notice that we use \def here instead of \bbl@redefine because \org@@citex is already defined and we don't want to overwrite that definition (it would result in parameter stack overflow because of a circular definition).

(Recent versions of natbib change dynamically \@citex, so PR4087 doesn't seem fixable in a simple way. Just load natbib before.)

```

3791   \def\@citex[#1][#2]#3{%
3792     \@safe@activetrue\edef\bbl@tempa{#3}\@safe@activestfalse
3793     \org@@citex[#1][#2]{\bbl@tempa}}%
3794   }{}

```

The package cite has a definition of \@citex where the shorthands need to be turned off in both arguments.

```

3795 \AtBeginDocument{%
3796   \ifpackageloaded{cite}{%
3797     \def\@citex[#1]#2{%
3798       \@safe@activetrue\org@@citex[#1][#2]\@safe@activestfalse}%
3799     }{}

```

**\nocite** The macro \nocite which is used to instruct BiBTeX to extract uncited references from the database.

```
3800 \bbl@redefine\nocite#1{%
3801   \@safe@activetrue\org@nocite{#1}\@safe@activesfalse}
```

**\bibcite** The macro that is used in the .aux file to define citation labels. When packages such as natbib or cite are not loaded its second argument is used to typeset the citation label. In that case, this second argument can contain active characters but is used in an environment where \@safe@activetrue is in effect. This switch needs to be reset inside the \hbox which contains the citation label. In order to determine during .aux file processing which definition of \bibcite is needed we define \bibcite in such a way that it redefines itself with the proper definition. We call \bbl@cite@choice to select the proper definition for \bibcite. This new definition is then activated.

```
3802 \bbl@redefine\bibcite{%
3803   \bbl@cite@choice
3804   \bibcite}
```

**\bbl@bibcite** The macro \bbl@bibcite holds the definition of \bibcite needed when neither natbib nor cite is loaded.

```
3805 \def\bbl@bibcite#1#2{%
3806   \org@bibcite{#1}\@safe@activesfalse#2}}
```

**\bbl@cite@choice** The macro \bbl@cite@choice determines which definition of \bibcite is needed. First we give \bibcite its default definition.

```
3807 \def\bbl@cite@choice{%
3808   \global\let\bibcite\bbl@bibcite
3809   \@ifpackageloaded{natbib}{\global\let\bibcite\org@bibcite}{}%
3810   \@ifpackageloaded{cite}{\global\let\bibcite\org@bibcite}{}%
3811   \global\let\bbl@cite@choice\relax}
```

When a document is run for the first time, no .aux file is available, and \bibcite will not yet be properly defined. In this case, this has to happen before the document starts.

```
3812 \AtBeginDocument{\bbl@cite@choice}
```

**\@bibitem** One of the two internal L<sup>A</sup>T<sub>E</sub>X macros called by \bibitem that write the citation label on the .aux file.

```
3813 \bbl@redefine\@bibitem#1{%
3814   \@safe@activetrue\org@@bibitem{#1}\@safe@activesfalse}
3815 \else
3816   \let\org@nocite\nocite
3817   \let\org@@citex\@citex
3818   \let\org@bibcite\bibcite
3819   \let\org@@bibitem\@bibitem
3820 \fi
```

## 5.2 Marks

**\markright** Because the output routine is asynchronous, we must pass the current language attribute to the head lines. To achieve this we need to adapt the definition of \markright and \markboth somewhat. However, headlines and footlines can contain text outside marks; for that we must take some actions in the output routine if the 'headfoot' options is used.

We need to make some redefinitions to the output routine to avoid an endless loop and to correctly handle the page number in bidi documents.

```
3821 \bbl@trace{Marks}
3822 \IfBabelLayout{sectioning}
3823   {\ifx\bbl@opt@headfoot\@nnil
3824     \g@addto@macro\@resetactivechars{%
3825       \set@typeset@protect
3826       \expandafter\select@language\x\expandafter{\bbl@main@language}%
3827       \let\protect\noexpand

3837                 {\org@markright{}}}%
3838                 {\toks@{#1}%
3839                 \bbl@exp{%
3840                     \\org@markright{\\protect\\foreignlanguage{\language}%
3841                         {\protect\\bbl@restore@actives\the\toks@}}}%

```

## **\markboth**

**\@mkboth** The definition of `\markboth` is equivalent to that of `\markright`, except that we need two token registers. The documentclasses report and book define and set the headings for the page. While doing so they also store a copy of `\markboth` in `\@mkboth`. Therefore we need to check whether `\@mkboth` has already been set. If so we need to do that again with the new definition of `\markboth`. (As of Oct 2019,  $\LaTeX$  stores the definition in an intermediate macro, so it's not necessary anymore, but it's preserved for older versions.)

```

3842     \ifx\@mkboth\markboth
3843         \def\bbl@tempc{\let\@mkboth\markboth}%
3844     \else

```

## **5.3 Preventing clashes with other packages**

### **5.3.1 ifthen**

**\ifthenelse** Sometimes a document writer wants to create a special effect depending on the page a certain fragment of text appears on. This can be achieved by the following piece of code:

```

% \ifthenelse{\isodd{\pageref{some-label}}}
%         {code for odd pages}
%         {code for even pages}
%

```

In order for this to work the argument of `\isodd` needs to be fully expandable. With the above redefinition of `\pageref` it is not in the case of this example. To overcome that, we add some code to the definition of `\ifthenelse` to make things work.

We want to revert the definition of `\pageref` and `\ref` to their original definition for the first argument of `\ifthenelse`, so we first need to store their current meanings.

Then we can set the `\@safe@actives` switch and call the original `\ifthenelse`. In order to be able to use shorthands in the second and third arguments of `\ifthenelse` the resetting of the switch *and* the definition of `\pageref` happens inside those arguments.

```

3861 \bbl@trace{Preventing clashes with other packages}
3862 \ifx\org@ref\undefined\else
3863   \bbl@xin@{R}\bbl@opt@safe
3864   \ifin@
3865     \AtBeginDocument{%
3866       \ifpackageloaded{ifthen}{%
3867         \bbl@redefine@long\ifthenelse#1#2#3{%
3868           \let\bbl@temp@pref\pageref
3869           \let\pageref\org@pageref
3870           \let\bbl@temp@ref\ref
3871           \let\ref\org@ref
3872           \@safe@activestru
3873           \org@ifthenelse{#1}%
3874           {\let\pageref\bbl@temp@pref
3875            \let\ref\bbl@temp@ref
3876            \@safe@activesfalse
3877            #2}%
3878           {\let\pageref\bbl@temp@pref
3879            \let\ref\bbl@temp@ref
3880            \@safe@activesfalse
3881            #3}%
3882         }%
3883       }{}%
3884     }
3885 \fi

```

### 5.3.2 varioref

**\@@vpageref**

**\vrefpagemum**

**\Ref** When the package varioref is in use we need to modify its internal command \@@vpageref in order to prevent problems when an active character ends up in the argument of \vref. The same needs to happen for \vrefpagemum.

```

3886 \AtBeginDocument{%
3887   \ifpackageloaded{varioref}{%
3888     \bbl@redefine\@@vpageref#1[#2]#3{%
3889       \@safe@activestru
3890       \org@@@vpageref{#1}[#2]{#3}%
3891       \@safe@activesfalse}%
3892     \bbl@redefine\vrefpagemum#1#2{%
3893       \@safe@activestru
3894       \org@vrefpagemum{#1}{#2}%
3895       \@safe@activesfalse}%

```

The package varioref defines \Ref to be a robust command which uppercases the first character of the reference text. In order to be able to do that it needs to access the expandable form of \ref. So we employ a little trick here. We redefine the (internal) command \Ref\_ to call \org@ref instead of \ref. The disadvantage of this solution is that whenever the definition of \Ref changes, this definition needs to be updated as well.

```

3896   \expandafter\def\csname Ref \endcsname#1{%
3897     \protected@edef\@tempa{\org@ref{#1}}\expandafter\MakeUppercase\@tempa}
3898   }{}%
3899 }
3900 \fi

```

### 5.3.3 hhline

**\hhline** Delaying the activation of the shorthand characters has introduced a problem with the hhline package. The reason is that it uses the ‘:’ character which is made active by the french support in babel. Therefore we need to *reload* the package when the ‘:’ is an active character. Note that this

happens *after* the category code of the @-sign has been changed to other, so we need to temporarily change it to letter again.

```

3901 \AtEndOfPackage{%
3902   \AtBeginDocument{%
3903     \@ifpackageloaded{hhline}%
3904       {\expandafter\ifx\cename normal@char\string\endcsname\relax
3905       \else
3906         \makeatletter
3907         \def\@currname{hhline}\input{hhline.sty}\makeatother
3908         \fi}%
3909     {}}}
```

**\substitutefontfamily** *Deprecated.* Use the tools provided by  $\LaTeX$

(\DeclareFontFamilySubstitution). The command \substitutefontfamily creates an .fd file on the fly. The first argument is an encoding mnemonic, the second and third arguments are font family names.

```

3910 \def\substitutefontfamily#1#2#3{%
3911   \lowercase{\immediate\openout15=#1#2.fd\relax}%
3912   \immediate\write15{%

3920     \string\DeclareFontShape{#1}{#2}{m}{sc}{<->ssub * #3/m/sc}{ }^J
3921     \string\DeclareFontShape{#1}{#2}{b}{n}{<->ssub * #3/bx/n}{ }^J
3922     \string\DeclareFontShape{#1}{#2}{b}{it}{<->ssub * #3/bx/it}{ }^J
3923     \string\DeclareFontShape{#1}{#2}{b}{sl}{<->ssub * #3/bx/sl}{ }^J
3924     \string\DeclareFontShape{#1}{#2}{b}{sc}{<->ssub * #3/bx/sc}{ }^J
3925   }%
3926   \closeout15
3927 }
3928 \@onlypreamble\substitutefontfamily
```

## 5.4 Encoding and fonts

Because documents may use non-ASCII font encodings, we make sure that the logos of  $\TeX$  and  $\LaTeX$  always come out in the right encoding. There is a list of non-ASCII encodings. Requested encodings are currently stored in \@fontenc@load@list. If a non-ASCII has been loaded, we define versions of \TeX and \LaTeX for them using \ensureascii. The default ASCII encoding is set, too (in reverse order): the “main” encoding (when the document begins), the last loaded, or OT1.

**\ensureascii**

```

3929 \bbl@trace{Encoding and fonts}
3930 \newcommand\BabelNonASCII{LGR,LGI,X2,OT2,OT3,OT6,LHE,LWN,LMA,LMC,LMS,LMU}
3931 \newcommand\BabelNonText{TS1,T3,TS3}
3932 \let\org@TeX\TeX
3933 \let\org@LaTeX\LaTeX
3934 \let\ensureascii\@firstofone
3935 \let\asciientcoding\@empty
3936 \AtBeginDocument{%
3937   \def\@elt#1{,#1,}%
3938   \edef\bbl@tempa{\expandafter\@gobbletwo\@fontenc@load@list}%
3939   \let\@elt\relax
3940   \let\bbl@tempb\@empty
3941   \def\bbl@tempc{OT1}%
3942   \bbl@foreach\BabelNonASCII{% LGR loaded in a non-standard way
3943     \bbl@ifunset{T@#1}{ }\def\bbl@tempb{#1}}}%
3944   \bbl@foreach\bbl@tempa{%
```

```

3945 \bbl@xin@{,#1,}{,\BabelNonASCII,}%
3946 \ifin@
3947 \def\bbl@tempb{#1}% Store last non-ascii
3948 \else\bbl@xin@{,#1,}{,\BabelNonText,}% Pass
3949 \ifin@else
3950 \def\bbl@tempc{#1}% Store last ascii
3951 \fi
3952 \fi}%
3953 \ifx\bbl@tempb\@empty\else
3954 \bbl@xin@{,\cf@encoding,}{,\BabelNonASCII,\BabelNonText,}%
3955 \ifin@else
3956 \edef\bbl@tempc{\cf@encoding}% The default if ascii wins
3957 \fi
3958 \let\asciencoding\bbl@tempc
3959 \renewcommand\ensureascii[1]{%
3960 {\fontencoding{\asciencoding}\selectfont#1}}%
3961 \DeclareTextCommandDefault{\TeX}{\ensureascii{\org@TeX}}%
3962 \DeclareTextCommandDefault{\LaTeX}{\ensureascii{\org@LaTeX}}%
3963 \fi}

```

Now comes the old deprecated stuff (with a little change in 3.9l, for fontspec). The first thing we need to do is to determine, at `\begin{document}`, which latin fontencoding to use.

**\latinencoding** When text is being typeset in an encoding other than ‘latin’ (OT1 or T1), it would be nice to still have Roman numerals come out in the Latin encoding. So we first assume that the current encoding at the end of processing the package is the Latin encoding.

```

3964 \AtEndOfPackage{\edef\latinencoding{\cf@encoding}}

```

But this might be overruled with a later loading of the package fontenc. Therefore we check at the execution of `\begin{document}` whether it was loaded with the T1 option. The normal way to do this (using `\ifpackageloaded`) is disabled for this package. Now we have to revert to parsing the internal macro `\@filelist` which contains all the filenames loaded.

```

3965 \AtBeginDocument{%
3966 \ifpackageloaded{fontspec}%
3967 {\xdef\latinencoding{%
3968 \ifx\UTFencname\@undefined
3969 EU\ifcase\bbl@engine\or2\or1\fi
3970 \else
3971 \UTFencname
3972 \fi}}%
3973 {\gdef\latinencoding{OT1}%
3974 \ifx\cf@encoding\bbl@t@one
3975 \xdef\latinencoding{\bbl@t@one}%
3976 \else
3977 \def\@elt#1{,#1,}%
3978 \edef\bbl@tempa{\expandafter\@gobbletwo\@fontenc@load@list}%
3979 \let\@elt\relax
3980 \bbl@xin@{,T1,}\bbl@tempa
3981 \ifin@
3982 \xdef\latinencoding{\bbl@t@one}%
3983 \fi
3984 \fi}}

```

**\latintext** Then we can define the command `\latintext` which is a declarative switch to a latin font-encoding. Usage of this macro is deprecated.

```

3985 \DeclareRobustCommand{\latintext}{%
3986 \fontencoding{\latinencoding}\selectfont
3987 \def\encodingdefault{\latinencoding}}

```

**\textlatin** This command takes an argument which is then typeset using the requested font encoding. In order to avoid many encoding switches it operates in a local scope.

```

3988 \ifx\@undefined\DeclareTextFontCommand

```

```

3989 \DeclareRobustCommand{\textlatin}[1]{\leavevmode{\latintext #1}}
3990 \else
3991 \DeclareTextFontCommand{\textlatin}{\latintext}
3992 \fi

```

For several functions, we need to execute some code with `\selectfont`. With  $\TeX$  2021-06-01, there is a hook for this purpose.

```

3993 \def\bbl@patchfont#1{\AddToHook{selectfont}{#1}}

```

## 5.5 Basic bidi support

This code is currently placed here for practical reasons. It will be moved to the correct place soon, I hope.

It is loosely based on `rlbabel.def`, but most of it has been developed from scratch. This `babel` module (by Johannes Braams and Boris Lavva) has served the purpose of typesetting R documents for two decades, and despite its flaws I think it is still a good starting point (some parts have been copied here almost verbatim), partly thanks to its simplicity. I’ve also looked at `ARABI` (by Youssef Jabri), which is compatible with `babel`.

There are two ways of modifying macros to make them “bidi”, namely, by patching the internal low-level macros (which is what I have done with lists, columns, counters, tocs, much like `rlbabel` did), and by introducing a “middle layer” just below the user interface (sectioning, footnotes).

- `pdftex` provides a minimal support for bidi text, and it must be done by hand. Vertical typesetting is not possible.
- `xetex` is somewhat better, thanks to its font engine (even if not always reliable) and a few additional tools. However, very little is done at the paragraph level. Another challenging problem is text direction does not honour  $\TeX$  grouping.
- `luatex` can provide the most complete solution, as we can manipulate almost freely the node list, the generated lines, and so on, but bidi text does not work out of the box and some development is necessary. It also provides tools to properly set left-to-right and right-to-left page layouts. As `Lua $\TeX$ -ja` shows, vertical typesetting is possible, too.

```

## 5.6 Local Language Configuration

**\loadlocalcfg** At some sites it may be necessary to add site-specific actions to a language definition file. This can be done by creating a file with the same name as the language definition file, but with the extension .cfg. For instance the file norsk.cfg will be loaded when the language definition file norsk.ldf is loaded.

For plain-based formats we don't want to override the definition of \loadlocalcfg from plain.def.

```

```

## 5.7 Language options

Languages are loaded when processing the corresponding option *except* if a main language has been set. In such a case, it is not loaded until all options has been processed. The following macro inputs the ldf file and does some additional checks (\input works, too, but possible errors are not caught).

```

4172 \bbl@trace{Language options}
4173 \let\bbl@afterlang\relax
4174 \let\babelModifiers\relax
4175 \let\bbl@loaded\@empty
4176 \def\bbl@load@language#1{%
4177   \InputIfFileExists{#1.ldf}%
4178   {\edef\bbl@loaded{\CurrentOption
4179     \ifx\bbl@loaded\@empty\else,\bbl@loaded\fi}%
4180     \expandafter\let\expandafter\bbl@afterlang
4181       \csname\CurrentOption.ldf-h@k\endcsname
4182     \expandafter\let\expandafter\babelModifiers
4183       \csname bbl@mod@\CurrentOption\endcsname
4184     \bbl@exp{\AtBeginDocument{%
4185       \bbl@usehooks@lang{\CurrentOption}{begindocument}{\CurrentOption}}}%
4186     {\IfFileExists{babel-#1.tex}%
4187     {\def\bbl@tempa{%
4188       .\There is a locale ini file for this language.\%

```

```

4189         If it's the main language, try adding `provide=*'\%
4190         to the babel package options}}%
4191     {\let\bbl@tempa\empty}%
4192     \bbl@error{unknown-package-option}{}}{}}

```

Now, we set a few language options whose names are different from ldf files. These declarations are preserved for backwards compatibility, but they must be eventually removed. Use proxy files instead.

```

4193 \def\bbl@try@load@lang#1#2#3{%
4194   \IfFileExists{\CurrentOption.ldf}%
4195   {\bbl@load@language{\CurrentOption}}%
4196   {#1\bbl@load@language{#2#3}}
4197 %
4198 \DeclareOption{hebrew}{%
4199   \ifcase\bbl@engine\or
4200     \bbl@error{only-pdftex-lang}{hebrew}{\luatex}}}%
4201 \fi
4202 \input{rlbabel.def}%
4203 \bbl@load@language{hebrew}}
4204 \DeclareOption{hungarian}{\bbl@try@load@lang{}{magyar}{}}
4205 \DeclareOption{lowersorbian}{\bbl@try@load@lang{}{lsorbian}{}}
4206 \DeclareOption{polutonikogreek}{%
4207   \bbl@try@load@lang{}{greek}{\languageattribute{greek}{polutoniko}}}
4208 \DeclareOption{russian}{\bbl@try@load@lang{}{russianb}{}}
4209 \DeclareOption{ukrainian}{\bbl@try@load@lang{}{ukraineb}{}}
4210 \DeclareOption{uppersorbian}{\bbl@try@load@lang{}{usorbian}{}}

```

Another way to extend the list of ‘known’ options for babel was to create the file `bblopts.cfg` in which one can add option declarations. However, this mechanism is deprecated – if you want an alternative name for a language, just create a new `.ldf` file loading the actual one. You can also set the name of the file with the package option `config=<name>`, which will load `<name>.cfg` instead.

```

4211 \ifx\bbl@opt@config\@nnil
4212   \ifpackagewith{babel}{noconfigs}}}%
4213   {\InputIfFileExists{bblopts.cfg}%
4214     {\typeout{*****^J%
4215               * Local config file bblopts.cfg used^^J%
4216               *}}}%
4217   }%
4218 \else
4219   \InputIfFileExists{\bbl@opt@config.cfg}%
4220   {\typeout{*****^J%
4221             * Local config file \bbl@opt@config.cfg used^^J%
4222             *}}}%
4223   {\bbl@error{config-not-found}}{}}{}}%
4224 \fi

```

Recognizing global options in packages not having a closed set of them is not trivial, as for them to be processed they must be defined explicitly. So, package options not yet taken into account and stored in `bbl@language@opts` are assumed to be languages. If not declared above, the names of the option and the file are the same. We first pre-process the class and package options to determine the main language, which is processed in the third ‘main’ pass, *except* if all files are `ldf` *and* there is no main key. In the latter case (`\bbl@opt@main` is still `\@nnil`), the traditional way to set the main language is kept — the last loaded is the main language.

```

4225 \ifx\bbl@opt@main\@nnil
4226   \ifnum\bbl@iniflag>z@ % if all ldf's: set implicitly, no main pass
4227   \let\bbl@tempb\empty
4228   \edef\bbl@tempa{\@classoptionslist,\bbl@language@opts}%
4229   \bbl@foreach\bbl@tempa{\edef\bbl@tempb{#1,\bbl@tempb}}%
4230   \bbl@foreach\bbl@tempb{% \bbl@tempb is a reversed list
4231     \ifx\bbl@opt@main\@nnil % ie, if not yet assigned
4232       \ifodd\bbl@iniflag % = *
4233       \IfFileExists{babel-#1.tex}{\def\bbl@opt@main{#1}}{}}%
4234     \else % n +=
4235       \IfFileExists{#1.ldf}{\def\bbl@opt@main{#1}}{}}%
4236   \fi

```

```

4237     \fi}%
4238 \fi
4239 \else
4240 \bbl@info{Main language set with 'main='. Except if you have\\%
4241         problems, prefer the default mechanism for setting\\%
4242         the main language, ie, as the last declared.\\%
4243         Reported}
4244 \fi

```

A few languages are still defined explicitly. They are stored in case they are needed in the ‘main’ pass (the value can be \relax).

```

4245 \ifx\bbl@opt@main\@nnil\else
4246 \bbl@ncarg\let\bbl@loadmain{ds@\bbl@opt@main}%
4247 \expandafter\let\csname ds@\bbl@opt@main\endcsname\relax
4248 \fi

```

Now define the corresponding loaders. With package options, assume the language exists. With class options, check if the option is a language by checking if the corresponding file exists.

```

4249 \bbl@foreach\bbl@language@opts{%
4250 \def\bbl@tempa{#1}%
4251 \ifx\bbl@tempa\bbl@opt@main\else
4252 \ifnum\bbl@iniflag<\tw@ % 0 0 (other = ldf)
4253 \bbl@ifunset{ds@#1}%
4254 {\DeclareOption{#1}{\bbl@load@language{#1}}}%
4255 {}%
4256 \else % + * (other = ini)
4257 \DeclareOption{#1}{%
4258 \bbl@ldfinit
4259 \babelprovide[import]{#1}%
4260 \bbl@afterldf{}}%
4261 \fi
4262 \fi}
4263 \bbl@foreach\@classoptionslist{%
4264 \def\bbl@tempa{#1}%
4265 \ifx\bbl@tempa\bbl@opt@main\else
4266 \ifnum\bbl@iniflag<\tw@ % 0 0 (other = ldf)
4267 \bbl@ifunset{ds@#1}%
4268 {\IfFileExists{#1.ldf}%
4269 {\DeclareOption{#1}{\bbl@load@language{#1}}}%
4270 {}}%
4271 {}%
4272 \else % + * (other = ini)
4273 \IfFileExists{babel-#1.tex}%
4274 {\DeclareOption{#1}{%
4275 \bbl@ldfinit
4276 \babelprovide[import]{#1}%
4277 \bbl@afterldf{}}}%
4278 {}%
4279 \fi
4280 \fi}

```

And we are done, because all options for this pass has been declared. Those already processed in the first pass are just ignored.

The options have to be processed in the order in which the user specified them (but remember class options are processed before):

```

4281 \def\AfterBabelLanguage#1{%
4282 \bbl@ifsamestring\CurrentOption{#1}{\global\bbl@add\bbl@afterlang{}}
4283 \DeclareOption*{}
4284 \ProcessOptions*

```

This finished the second pass. Now the third one begins, which loads the main language set with the key main. A warning is raised if the main language is not the same as the last named one, or if the value of the key main is not a language. With some options in provide, the package luatexbase is loaded (and immediately used), and therefore \babelprovide can’t go inside a \DeclareOption; this

explains why it's executed directly, with a dummy declaration. Then all languages have been loaded, so we deactivate \AfterBabelLanguage.

```

4285 \bbl@trace{Option 'main'}

## 6 The kernel of Babel (babel.def, common)

The kernel of the babel system is currently stored in babel.def. The file babel.def contains most of the code. The file hyphen.cfg is a file that can be loaded into the format, which is necessary when you want to be able to switch hyphenation patterns.

Because plain  $\TeX$  users might want to use some of the features of the babel system too, care has to be taken that plain  $\TeX$  can process the files. For this reason the current format will have to be checked in a number of places. Some of the code below is common to plain  $\TeX$  and  $\LaTeX$ , some of it is for the  $\LaTeX$  case only.

Plain formats based on etex (etex, xetex, luatex) don't load hyphen.cfg but etex.src, which follows a different naming convention, so we need to define the babel names. It presumes language.def exists and it is the same file used when formats were created.

A proxy file for switch.def

```

4336 <kernel>
4337 \let\bbl@onlyswitch\@empty

```

## 7 Loading hyphenation patterns

The following code is meant to be read by `iniTEX` because it should instruct `TEX` to read hyphenation patterns. To this end the `docstrip` option `patterns` is used to include this code in the file `hyphen.cfg`. Code is written with lower level macros.

```

4543 <@Make sure ProvidesFile is defined@>
4544 \ProvidesFile{hyphen.cfg}[<@date@> v<@version@> Babel hyphens]
4545 \xdef\bbl@format{\jobname}
4546 \def\bbl@version{<@version@>}
4547 \def\bbl@date{<@date@>}
4548 \ifx\AtBeginDocument\@undefined
4549   \def\@empty{}
4550 \fi
4551 <@Define core switching macros@>

```

**\process@line** Each line in the file `language.dat` is processed by `\process@line` after it is read. The first thing this macro does is to check whether the line starts with `=`. When the first token of a line is an `=`, the macro `\process@synonym` is called; otherwise the macro `\process@language` will continue.

```

4552 \def\process@line#1#2 #3 #4 {%
4553   \ifx=#1%
4554     \process@synonym{#2}%
4555   \else
4556     \process@language{#1#2}{#3}{#4}%
4557   \fi
4558   \ignorespaces}

```

**\process@synonym** This macro takes care of the lines which start with an `=`. It needs an empty token register to begin with. `\bbl@languages` is also set to empty.

```

4559 \toks@{}
4560 \def\bbl@languages{}

```

When no languages have been loaded yet, the name following the `=` will be a synonym for hyphenation register 0. So, it is stored in a token register and executed when the first pattern file has been processed. (The `\relax` just helps to the `\if` below catching synonyms without a language.)

Otherwise the name will be a synonym for the language loaded last.  
We also need to copy the hyphenmin parameters for the synonym.

```

4561 \def\process@synonym#1{%
4562   \ifnum\last@language=\m@ne
4563     \toks@\expandafter{\the\toks@\relax\process@synonym{#1}}%
4564   \else
4565     \expandafter\chardef\csname l@#1\endcsname\last@language
4566     \wlog{\string\l@#1=\string\language\the\last@language}%
4567     \expandafter\let\csname #1hyphenmins\expandafter\endcsname
4568       \csname\language\hyphenmins\endcsname
4569     \let\bbl@elt\relax
4570     \edef\bbl@languages{\bbl@languages\bbl@elt{#1}{\the\last@language}{}}%
4571   \fi}

```

**\process@language** The macro `\process@language` is used to process a non-empty line from the ‘configuration file’. It has three arguments, each delimited by white space. The first argument is the ‘name’ of a language; the second is the name of the file that contains the patterns. The optional third argument is the name of a file containing hyphenation exceptions.

The first thing to do is call `\addlanguage` to allocate a pattern register and to make that register ‘active’. Then the pattern file is read.

For some hyphenation patterns it is needed to load them with a specific font encoding selected. This can be specified in the file `language.dat` by adding for instance ‘: T1’ to the name of the language. The macro `\bbl@get@enc` extracts the font encoding from the language name and stores it in `\bbl@hyph@enc`. The latter can be used in hyphenation files if you need to set a behavior depending on the given encoding (it is set to empty if no encoding is given).

Pattern files may contain assignments to `\lefthyphenmin` and `\righthyphenmin`. T<sub>E</sub>X does not keep track of these assignments. Therefore we try to detect such assignments and store them in the `\langle language \rangle hyphenmins` macro. When no assignments were made we provide a default setting. Some pattern files contain changes to the `\lccode` or `\uccode` arrays. Such changes should remain local to the language; therefore we process the pattern file in a group; the `\patterns` command acts globally so its effect will be remembered.

Then we globally store the settings of `\lefthyphenmin` and `\righthyphenmin` and close the group. When the hyphenation patterns have been processed we need to see if a file with hyphenation exceptions needs to be read. This is the case when the third argument is not empty and when it does not contain a space token. (Note however there is no need to save hyphenation exceptions into the format.)

`\bbl@languages` saves a snapshot of the loaded languages in the form `\bbl@elt{<language-name>}{<number>}{<patterns-file>}{<exceptions-file>}`. Note the last 2 arguments are empty in ‘dialects’ defined in `language.dat` with `=`. Note also the language name can have encoding info.

Finally, if the counter `\language` is equal to zero we execute the synonyms stored.

```

4572 \def\process@language#1#2#3{%
4573   \expandafter\addlanguage\csname l@#1\endcsname
4574   \expandafter\language\csname l@#1\endcsname
4575   \edef\language#1{%
4576     \bbl@hook@everylanguage{#1}%
4577     % > luatex
4578     \bbl@get@enc#1::\@@@
4579   \begingroup
4580     \lefthyphenmin\m@ne
4581     \bbl@hook@loadpatterns{#2}%

```

**readconfigfile** The configuration file can now be opened for reading.

```

4673 \openin1 = language.dat

```

See if the file exists, if not, use the default hyphenation file hyphen.tex. The user will be informed about this.

```

4674 \def\language{english}%
4675 \ifeof1
4676   \message{I couldn't find the file language.dat,\space
4677           I will try the file hyphen.tex}
4678   \input hyphen.tex\relax
4679   \chardef\l@english\z@
4680 \else

```

Pattern registers are allocated using count register \last@language. Its initial value is 0. The definition of the macro \newlanguage is such that it first increments the count register and then defines the language. In order to have the first patterns loaded in pattern register number 0 we initialize \last@language with the value -1.

```

4681 \last@language@m@ne

```

We now read lines from the file until the end is found. While reading from the input, it is useful to switch off recognition of the end-of-line character. This saves us stripping off spaces from the contents of the control sequence.

```

4682 \loop
4683   \endlinechar@m@ne
4684   \read1 to \bbl@line
4685   \endlinechar\^^M

```

If the file has reached its end, exit from the loop here. If not, empty lines are skipped. Add 3 space characters to the end of \bbl@line. This is needed to be able to recognize the arguments of \process@line later on. The default language should be the very first one.

```

4686   \if T\ifeof1\fi T\relax
4687   \ifx\bbl@line\@empty\else
4688     \edef\bbl@line{\bbl@line\space\space\space}%
4689     \expandafter\process@line\bbl@line\relax
4690   \fi
4691 \repeat

```

Check for the end of the file. We must reverse the test for `\ifeof` without `\else`. Then reactivate the default patterns, and close the configuration file.

```

4692 \begingroup
4693   \def\bb@elt#1#2#3#4{%
4694     \global\language=#2\relax
4695     \gdef\language#1}%

```

Here the code for `iniTEX` ends.

## 8 Font handling with fontspec

Add the bidi handler just before `luaotfload`, which is loaded by default by LaTeX. Just in case, consider the possibility it has not been loaded. First, a couple of definitions related to bidi [misplaced].

```

4717 <<*<More package options>> >> ≡
4718 \chardef\bb@bidimode\z@
4719 \DeclareOption{bidi=default}{\chardef\bb@bidimode=\@ne}
4720 \DeclareOption{bidi=basic}{\chardef\bb@bidimode=101 }
4721 \DeclareOption{bidi=basic-r}{\chardef\bb@bidimode=102 }
4722 \DeclareOption{bidi=bidi}{\chardef\bb@bidimode=201 }
4723 \DeclareOption{bidi=bidi-r}{\chardef\bb@bidimode=202 }
4724 \DeclareOption{bidi=bidi-l}{\chardef\bb@bidimode=203 }
4725 <</More package options>>

```

With explicit languages, we could define the font at once, but we don't. Just wait and see if the language is actually activated. `bb@font` replaces hardcoded font names inside `\. . family` by the corresponding macro `\. . default`.

```

4726 <<*<Font selection>> >> ≡
4727 \bb@trace{Font handling with fontspec}

Now the macros defining the font with `fontspec`.

When there are repeated keys in `fontspec`, the last value wins. So, we just place the ini settings at the beginning, and user settings will take precedence. We must deactivate temporarily `\bbl@mapselect` because `\selectfont` is called internally when a font is defined.

For historical reasons,  $\text{\LaTeX}$  can select two different series (bx and b), for what is conceptually a single one. This can lead to problems when a single family requires several fonts, depending on the language, mainly because ‘substitutions’ with some combinations are not done consistently – sometimes `bx/sc` is the correct font, but sometimes points to `b/n`, even if `b/sc` exists. So, some substitutions are redefined (in a somewhat hackish way, by inspecting if the variant declaration contains `>ssub*`).

## 10 Support for interchar

xetex reserves some values for CJK (although they are not set in XELATEX), so we make sure they are skipped. Define some user names for the global classes, too.

```

5006 \ifnum\xe@alloc@intercharclass<\thr@@
5007 \xe@alloc@intercharclass\thr@@
5008 \fi
5009 \chardef\bb@xe@class@default@=\z@
5010 \chardef\bb@xe@class@cjkideogram@=\@ne
5011 \chardef\bb@xe@class@cjkleftpunctuation@=\tw@
5012 \chardef\bb@xe@class@cjkrightpunctuation@=\thr@@

```

```

5013 \chardef\bbl@xeclass@boundary@=4095
5014 \chardef\bbl@xeclass@ignore@=4096

```

The machinery is activated with a hook (enabled only if actually used). Here `\bbl@tempc` is pre-set with `\bbl@usingxeclass`, defined below. The standard mechanism based on `\originalTeX` to save, set and restore values is used. `\count@` stores the previous char to be set, except at the beginning (0) and after `\bbl@upto`, which is the previous char negated, as a flag to mark a range.

```

5015 \AddBabelHook{babel-interchar}{beforeextras}{%
5016   \nameuse{bbl@xechars@\language@}}
5017 \DisableBabelHook{babel-interchar}
5018 \protected\def\bbl@charclass#1{%
5019   \ifnum\count@<\z@
5020     \count@-\count@
5021     \loop
5022       \bbl@exp{%
5023         \\babel@savevariable{\XeTeXcharclass`\Uchar\count@}%
5024         \XeTeXcharclass\count@ \bbl@tempc
5025         \ifnum\count@<`#1\relax
5026           \advance\count@ \@ne
5027         \repeat
5028       \else
5029         \babel@savevariable{\XeTeXcharclass`#1}%
5030         \XeTeXcharclass`#1 \bbl@tempc
5031       \fi
5032     \count@`#1\relax}

```

Now the two user macros. Char classes are declared implicitly, and then the macro to be executed at the `babel-interchar` hook is created. The list of chars to be handled by the hook defined above has internally the form `\bbl@usingxeclass\bbl@xeclass@punct@english\bbl@charclass{.}` `\bbl@charclass{,}` (etc.), where `\bbl@usingxeclass` stores the class to be applied to the subsequent characters. The `\ifcat` part deals with the alternative way to enter characters as macros (eg, `\`). As a special case, hyphens are stored as `\bbl@upto`, to deal with ranges.

```

## 10.1 Layout

Note elements like headlines and margins can be modified easily with packages like `fancyhdr`, `typearea` or `titleps`, and `geometry`.

`\bbl@startskip` and `\bbl@endskip` are available to package authors. Thanks to the  $\TeX$  expansion mechanism the following constructs are valid: `\adim\bbl@startskip`, `\advance\bbl@startskip\adim`, `\bbl@startskip\adim`.

Consider `txtbabel` as a shorthand for *tex-xet babel*, which is the bidi model in both `pdftex` and `xetex`.

```

### 10.3 LuaTeX

The loader for luatex is based solely on `language.dat`, which is read on the fly. The code shouldn't be executed when the format is build, so we check if `\AddBabelHook` is defined. Then comes a modified version of the loader in `hyphen.cfg` (without the `hyphenmins` stuff, which is under the direct control of `babel`).

The names `\l@<language>` are defined and take some value from the beginning because all `ldf` files assume this for the corresponding language to be considered valid, but patterns are not loaded (except the first one). This is done later, when the language is first selected (which usually means when the `ldf` finishes). If a language has been loaded, `\bbl@hyphendata@<num>` exists (with the names of the files read).

The default setup preloads the first language into the format. This is intended mainly for 'english', so that it's available without further intervention from the user. To avoid duplicating it, the following rule applies: if the "0th" language and the first language in `language.dat` have the same name then just ignore the latter. If there are new synonymous, they are added, but note if the language patterns have not been preloaded they won't at run time.

Other preloaded languages could be read twice, if they have been preloaded into the format. This is not optimal, but it shouldn't happen very often – with luatex patterns are best loaded when the document is typeset, and the "0th" language is preloaded just for backwards compatibility.

As of 1.1b, lua(e)tex is taken into account. Formerly, loading of patterns on the fly didn't work in this format, but with the new loader it does. Unfortunately, the format is not based on `babel`, and data could be duplicated, because languages are reassigned above those in the format (nothing serious, anyway). Note even with this format `language.dat` is used (under the principle of a single source), instead of `language.def`.

Of course, there is room for improvements, like tools to read and reassign languages, which would require modifying the language list, and better error handling.

We need catcode tables, but no format (targeted by `babel`) provide a command to allocate them (although there are packages like `ctablestack`). FIX - This isn't true anymore. For the moment, a dangerous approach is used - just allocate a high random number and cross the fingers. To complicate things, `etex.sty` changes the way languages are allocated.

This files is read at three places: (1) when `plain.def`, `babel.sty` starts, to read the list of available languages from `language.dat` (for the base option); (2) at `hyphen.cfg`, to modify some macros; (3) in the middle of `plain.def` and `babel.sty`, by `babel.def`, with the commands and other definitions for luatex (eg, `\babelpatterns`).

## 10.4 Southeast Asian scripts

First, some general code for line breaking, used by `\babelposthyphenation`. Replace regular (ie, implicit) discretionaries by spaceskips, based on the previous glyph (which I think makes sense, because the hyphen and the previous char go always together). Other discretionaries are not touched. See Unicode UAX 14.

## 10.5 CJK line breaking

Minimal line breaking for CJK scripts, mainly intended for simple documents and short texts as a secondary language. Only line breaking, with a little stretching for justification, without any attempt to adjust the spacing. It is based on (but does not strictly follow) the Unicode algorithm.

We first need a little table with the corresponding line breaking properties. A few characters have an additional key for the width (fullwidth vs. halfwidth), not yet used. There is a separate file, defined below.

```

## 10.7 Common stuff

```
6048 <@Font selection@>
```

## 10.8 Automatic fonts and ids switching

After defining the blocks for a number of scripts (must be extended and very likely fine tuned), we define a the function `Babel.locale_map`, which just traverse the node list to carry out the replacements. The table `loc_to_scr` stores the script range for each locale (whose id is the key), copied from this table (so that it can be modified on a locale basis); there is an intermediate table named `chr_to_loc` built on the fly for optimization, which maps a char to the locale. This locale is then used to get the `\language` as stored in `locale_props`, as well as the font (as requested). In the latter table a key starting with / maps the font from the global one (the key) to the local one (the value). Maths are skipped and discretionaries are handled in a special way.

```

Post-handling hyphenation patterns for non-standard rules, like ff to ff-f. There are still some issues with speed (not very slow, but still slow). The Lua code is below.

```

6218 \directlua{
6219   Babel.nohyphenation = \the\l@nohyphenation
6220 }

```

Now the  $\TeX$  high level interface, which requires the function defined above for converting strings to functions returning a string. These functions handle the  $\{n\}$  syntax. For example,  $\text{pre}=\{1\}\{1\}$  becomes `function(m) return m[1]..m[1]..'-' end`, where  $m$  are the matches returned after applying the pattern. With a mapped capture the functions are similar to `function(m) return Babel.capt_map(m[1],1) end`, where the last argument identifies the mapping to be applied to  $m[1]$ . The way it is carried out is somewhat tricky, but the effect is not dissimilar to lua `load` – save the code as string in a  $\TeX$  macro, and expand this macro at the appropriate place. As `\directlua` does not take into account the current catcode of `@`, we just avoid this character in macro names (which explains the internal group, too).

```

```

The following experimental (and unfinished) macro applies the prehyphenation transforms for the current locale to a string (characters and spaces) and processes it in a fully expandable way (among other limitations, the string can't contain ]=]). The way it operates is admittedly rather cumbersome: it converts the string to a node list, processes it, and converts it back to a string. The lua code is in the lua file below.

```

6398 \newcommand\localeprehyphenation[1]{%
6399 \directlua{ Babel.string_prehyphenation([=[#1]=], \the\localeid) }}

```

## 10.9 Bidi

As a first step, add a handler for bidi and digits (and potentially other processes) just before luaotfload is applied, which is loaded by default by L<sup>A</sup>T<sub>E</sub>X. Just in case, consider the possibility it has not been loaded.

```

6400 \def\bbl@activate@preotf{%
6401 \let\bbl@activate@preotf\relax % only once

6436 }}

```

The basic setup. The output is modified at a very low level to set the \bodydir to the \pagedir. Sadly, we have to deal with boxes in math with basic, so the \bbl@mathboxdir hack is activated every math with the package option bidi=. The hack for the PUA is no longer necessary with basic (24.8), but it's kept in basic-r.

## 10.10 Layout

Unlike xetex, luatex requires only minimal changes for right-to-left layouts, particularly in monolingual documents (the engine itself reverses boxes – including column order or headings –, margins, etc.) with `bidi=basic`, without having to patch almost any macro where text direction is relevant.

Still, there are three areas deserving special attention, namely, tabular, math, and graphics, text and intrinsically left-to-right elements are intermingled. I’ve made some progress in graphics, but they’re essentially hacks; I’ve also made some progress in ‘tabular’, but when I decided to tackle math (both standard math and ‘amsmath’) the nightmare began. I’m still not sure how ‘amsmath’ should be modified, but the main problem is that, boxes are “generic” containers that can hold text, math, and graphics (even at the same time; remember that inline math is included in the list of text nodes marked with ‘math’ (11) nodes too).

`\@hangfrom` is useful in many contexts and it is redefined always with the `layout` option.

There are, however, a number of issues when the text direction is not the same as the box direction (as set by `\bodydir`), and when `\parbox` and `\hangindent` are involved. Fortunately, latest releases of luatex simplify a lot the solution with `\shapemode`.

With the issue #15 I realized commands are best patched, instead of redefined. With a few lines, a modification could be applied to several classes and packages. Now, `tabular` seems to work (at least in simple cases) with `array`, `tabularx`, `hhline`, `colortbl`, `longtable`, `booktabs`, etc. However, `dcolumn` still fails.

```

OMEGA provided a companion to `\mathdir` (`\nextfakemath`) for those cases where we did not want it to be applied, so that the writing direction of the main text was left unchanged. `\bbl@nextfake` is an attempt to emulate it, because `luatex` has removed it without an alternative. Also, `\hangindent` does not honour direction changes by default, so we need to redefine `\@hangfrom`.

```

Implicitly reverses sectioning labels in bidi=basic-r, because the full stop is not in contact with L numbers any more. I think there must be a better way. Assumes bidi=basic, but there are some additional readjustments for bidi=default.

## 10.11 Lua: transforms

After declaring the table containing the patterns with their replacements, we define some auxiliary functions: `str_to_nodes` converts the string returned by a function to a node list, taking the node at base as a model (font, language, etc.); `fetch_word` fetches a series of glyphs and discretionaries, which pattern is matched against (if there is a match, it is called again before trying other patterns, and this is very likely the main bottleneck).

`post_hyphenate_replace` is the callback applied after `lang.hyphenate`. This means the automatic hyphenation points are known. As empty captures return a byte position (as explained in the `luatex` manual), we must convert it to a utf8 position. With `first`, the last byte can be the leading byte in a utf8 sequence, so we just remove it and add 1 to the resulting length. With `last` we must take into account the capture position points to the next character. Here `word_head` points to the starting node of the text to be matched.

## 10.12 Lua: Auto bidi with basic and basic-r

The file `babel-data-bidi.lua` currently only contains data. It is a large and boring file and it is not shown here (see the generated file), but here is a sample:

```

% [0x25]={d='et'},
% [0x26]={d='on'},
% [0x27]={d='on'},
% [0x28]={d='on', m=0x29},
% [0x29]={d='on', m=0x28},
% [0x2A]={d='on'},
% [0x2B]={d='es'},
% [0x2C]={d='cs'},
%

```

For the meaning of these codes, see the Unicode standard.

Now the `basic-r` bidi mode. One of the aims is to implement a fast and simple bidi algorithm, with a single loop. I managed to do it for R texts, with a second smaller loop for a special case. The code is still somewhat chaotic, but its behavior is essentially correct. I cannot resist copying the following text from Emacs `bidi.c` (which also attempts to implement the bidi algorithm with a single loop):

Arrrgh!! The UAX#9 algorithm is too deeply entrenched in the assumption of batch-style processing [...]. May the fleas of a thousand camels infest the armpits of those who design supposedly general-purpose algorithms by looking at their own implementations, and fail to consider other possible implementations!

Well, it took me some time to guess what the batch rules in UAX#9 actually mean (in other word, *what* they do and *why*, and not only *how*), but I think (or I hope) I've managed to understand them. In some sense, there are two bidi modes, one for numbers, and the other for text. Furthermore, setting just the direction in R text is not enough, because there are actually *two* R modes (set explicitly in Unicode with RLM and ALM). In babel the `dir` is set by a higher protocol based on the language/script, which in turn sets the correct `dir` (`<l>`, `<r>` or `<al>`).

From UAX#9: "Where available, markup should be used instead of the explicit formatting characters". So, this simple version just ignores formatting characters. Actually, most of that annex is devoted to how to handle them.

BD14-BD16 are not implemented. Unicode (and the W3C) are making a great effort to deal with some special problematic cases in "streamed" plain text. I don't think this is the way to go – particular issues should be fixed by a high level interface taking into account the needs of the document. And here is where `luatex` excels, because everything related to bidi writing is under our control.

```
7562 (*basic-r)
7563 Babel = Babel or {}
7564
7565 Babel.bidi_enabled = true
7566
7567 require('babel-data-bidi.lua')
7568
7569 local characters = Babel.characters
7570 local ranges = Babel.ranges
7571
7572 local DIR = node.id("dir")
7573
7574 local function dir_mark(head, from, to, outer)
7575   dir = (outer == 'r') and 'TLT' or 'TRT' -- ie, reverse
7576   local d = node.new(DIR)
7577   d.dir = '+' .. dir
7578   node.insert_before(head, from, d)
7579   d = node.new(DIR)
7580   d.dir = '-' .. dir
7581   node.insert_after(head, to, d)
7582 end
7583
7584 function Babel.bidi(head, ispar)
7585   local first_n, last_n          -- first and last char with nums
7586   local last_es                  -- an auxiliary 'last' used with nums
7587   local first_d, last_d          -- first and last char in L/R block
7588   local dir, dir_real
```

Next also depends on `script/lang` (`<al>/<r>`). To be set by `babel.tex.pardir` is dangerous, could be (re)set but it should be changed only in `vmode`. There are two strong's – `strong = l/al/r` and `strong_lr = l/r` (there must be a better way):

```
7589   local strong = ('TRT' == tex.pardir) and 'r' or 'l'
7590   local strong_lr = (strong == 'l') and 'l' or 'r'
7591   local outer = strong
7592
7593   local new_dir = false
7594   local first_dir = false
7595   local inmath = false
7596
7597   local last_lr
```

```

7598
7599 local type_n = ''
7600
7601 for item in node.traverse(head) do
7602     -- three cases: glyph, dir, otherwise
7603     if item.id == node.id'glyph'
7604         or (item.id == 7 and item.subtype == 2) then
7605
7606         local itemchar
7607         if item.id == 7 and item.subtype == 2 then
7608             itemchar = item.replace.char
7609         else
7610             itemchar = item.char
7611         end
7612         local chardata = characters[itemchar]
7613         dir = chardata and chardata.d or nil
7614         if not dir then
7615             for nn, et in ipairs(ranges) do
7616                 if itemchar < et[1] then
7617                     break
7618                 elseif itemchar <= et[2] then
7619                     dir = et[3]
7620                     break
7621                 end
7622             end
7623         end
7624         dir = dir or 'l'
7625         if inmath then dir = ('TRT' == tex.mathdir) and 'r' or 'l' end
7626

```

Next is based on the assumption babel sets the language *and* switches the script with its dir. We treat a language block as a separate Unicode sequence. The following piece of code is executed at the first glyph after a ‘dir’ node. We don’t know the current language until then. This is not exactly true, as the math mode may insert explicit dirs in the node list, so, for the moment there is a hack by brute force (just above).

```

7627     if new_dir then
7628         attr_dir = 0
7629         for at in node.traverse(item.attr) do
7630             if at.number == Babel.attr_dir then
7631                 attr_dir = at.value & 0x3
7632             end
7633         end
7634         if attr_dir == 1 then
7635             strong = 'r'
7636         elseif attr_dir == 2 then
7637             strong = 'al'
7638         else
7639             strong = 'l'
7640         end
7641         strong_lr = (strong == 'l') and 'l' or 'r'
7642         outer = strong_lr
7643         new_dir = false
7644     end
7645
7646     if dir == 'nsm' then dir = strong end -- W1

```

**Numbers.** The dual <al>/<r> system for R is somewhat cumbersome.

```

7647     dir_real = dir -- We need dir_real to set strong below
7648     if dir == 'al' then dir = 'r' end -- W3

```

By W2, there are no <en> <et> <es> if strong == <al>, only <an>. Therefore, there are not <et en> nor <en et>, W5 can be ignored, and W6 applied:

```

7649     if strong == 'al' then
7650         if dir == 'en' then dir = 'an' end -- W2

```

```

7651         if dir == 'et' or dir == 'es' then dir = 'on' end -- W6
7652         strong_lr = 'r' -- W3
7653     end

```

Once finished the basic setup for glyphs, consider the two other cases: dir node and the rest.

```

7654     elseif item.id == node.id'dir' and not inmath then
7655         new_dir = true
7656         dir = nil
7657     elseif item.id == node.id'math' then
7658         inmath = (item.subtype == 0)
7659     else
7660         dir = nil -- Not a char
7661     end

```

Numbers in R mode. A sequence of <en>, <et>, <an>, <es> and <cs> is typeset (with some rules) in L mode. We store the starting and ending points, and only when anything different is found (including nil, ie, a non-char), the textdir is set. This means you cannot insert, say, a whatsit, but this is what I would expect (with luacolor you may colorize some digits). Anyway, this behavior could be changed with a switch in the future. Note in the first branch only <an> is relevant if <al>.

```

7662     if dir == 'en' or dir == 'an' or dir == 'et' then
7663         if dir ~= 'et' then
7664             type_n = dir
7665         end
7666         first_n = first_n or item
7667         last_n = last_es or item
7668         last_es = nil
7669     elseif dir == 'es' and last_n then -- W3+W6
7670         last_es = item
7671     elseif dir == 'cs' then -- it's right - do nothing
7672     elseif first_n then -- & if dir = any but en, et, an, es, cs, inc nil
7673         if strong_lr == 'r' and type_n ~= '' then

7684     end

```

R text in L, or L text in R. Order of dir\_ mark's are relevant: d goes outside n, and therefore it's emitted after. See dir\_mark to understand why (but is the nesting actually necessary or is a flat dir structure enough?). Only L, R (and AL) chars are taken into account – everything else, including spaces, whatsits, etc., are ignored:

```

7685     if dir == 'l' or dir == 'r' then
7686         if dir ~= outer then
7687             first_d = first_d or item
7688             last_d = item
7689         elseif first_d and dir ~= strong_lr then
7690             dir_mark(head, first_d, last_d, outer)
7691             first_d, last_d = nil, nil
7692         end
7693     end

```

**Mirroring.** Each chunk of text in a certain language is considered a “closed” sequence. If <r on r> and <l on l>, it's clearly <r> and <l>, resptly, but with other combinations depends on outer. From all these, we select only those resolving <on> → <r>. At the beginning (when last\_lr is nil) of an R text, they are mirrored directly. Numbers in R mode are processed. It should not be done, but it doesn't hurt.

```

7694     if dir and not last_lr and dir ~= 'l' and outer == 'r' then
7695         item.char = characters[item.char] and
7696             characters[item.char].m or item.char

```

```

7697 elseif (dir or new_dir) and last_lr ~= item then
7698     local mir = outer .. strong_lr .. (dir or outer)
7699     if mir == 'rrr' or mir == 'lrr' or mir == 'rrl' or mir == 'rlr' then
7700         for ch in node.traverse(node.next(last_lr)) do
7701             if ch == item then break end
7702             if ch.id == node.id'glyph' and characters[ch.char] then
7703                 ch.char = characters[ch.char].m or ch.char
7704             end
7705         end
7706     end
7707 end

```

Save some values for the next iteration. If the current node is 'dir', open a new sequence. Since dir could be changed, strong is set with its real value (dir\_real).

```

7708 if dir == 'l' or dir == 'r' then
7709     last_lr = item
7710     strong = dir_real -- Don't search back - best save now
7711     strong_lr = (strong == 'l') and 'l' or 'r'
7712 elseif new_dir then
7713     last_lr = nil
7714 end
7715 end

```

Mirror the last chars if they are no directed. And make sure any open block is closed, too.

```

7716 if last_lr and outer == 'r' then
7717     for ch in node.traverse_id(node.id'glyph', node.next(last_lr)) do
7718         if characters[ch.char] then
7719             ch.char = characters[ch.char].m or ch.char
7720         end
7721     end
7722 end
7723 if first_n then
7724     dir_mark(head, first_n, last_n, outer)
7725 end
7726 if first_d then
7727     dir_mark(head, first_d, last_d, outer)
7728 end

```

In boxes, the dir node could be added before the original head, so the actual head is the previous node.

```

7729 return node.prev(head) or head
7730 end
7731 </basic-r>

```

## 11 Data for CJK

It is a boring file and it is not shown here (see the generated file), but here is a sample:

```
% [0x0021]={c='ex'},
% [0x0024]={c='pr'},
% [0x0025]={c='po'},
% [0x0028]={c='op'},
% [0x0029]={c='cp'},
% [0x002B]={c='pr'},
%
```

For the meaning of these codes, see the Unicode standard.

## 12 The ‘nil’ language

This ‘language’ does nothing, except setting the hyphenation patterns to nohyphenation. For this language currently no special definitions are needed or available.

The macro `\LdfInit` takes care of preventing that this file is loaded more than once, checking the category code of the `@` sign, etc.

```
8188 <*nil>
8189 \ProvidesLanguage{nil}[<@date@> v<@version@> Nil language]
8190 \LdfInit{nil}{datenil}
```

When this file is read as an option, i.e. by the `\usepackage` command, `nil` could be an ‘unknown’ language in which case we have to make it known.

```
8191 \ifx\l@nil\undefined
8192 \newlanguage\l@nil
8193 \namedef{bbl@hyphendata@the\l@nil}{\{}}% Remove warning
8194 \let\bbl@elt@relax
8195 \edef\bbl@languages{% Add it to the list of languages
8196 \bbl@languages\bbl@elt{nil}{\the\l@nil}\{}}
8197 \fi
```

This macro is used to store the values of the hyphenation parameters `\lefthyphenmin` and `\righthyphenmin`.

```
8198 \providehyphenmins{\CurrentOption}{\m@ne\m@ne}
```

The next step consists of defining commands to switch to (and from) the ‘nil’ language.

### `\captionnil`

### `\datenil`

```
8199 \let\captionnil\@empty
8200 \let\datenil\@empty
```

There is no locale file for this pseudo-language, so the corresponding fields are defined here.

```
8201 \def\bbl@inidata@nil{%
8202 \bbl@elt{identification}{tag.ini}{und}%
8203 \bbl@elt{identification}{load.level}{0}%

8226 \@namedef{bbl@sname@nil}{Latin}
8227 \@namedef{bbl@sbc@nil}{Latn}
8228 \@namedef{bbl@sotf@nil}{latn}

```

The macro `\ldf@finish` takes care of looking for a configuration file, setting the main language to be switched on at `\begin{document}` and resetting the category code of `@` to its original value.

```

8229 \ldf@finish{nil}
8230 </nil>

```

## 13 Calendars

The code for specific calendars are placed in the specific files, loaded when requested by an ini file in the identification section with `require.calendars`.

Start with function to compute the Julian day. It's based on the little library `calendar.js`, by John Walker, in the public domain.

```

8231 <<*Compute Julian day>> ≡
8232 \def\bbl@fpmo#1#2{(#1-#2*floor(#1/#2))}
8233 \def\bbl@cs@gregleap#1{%
8234   (\bbl@fpmo{#1}{4} == 0) &&
8235   (!((\bbl@fpmo{#1}{100} == 0) && (\bbl@fpmo{#1}{400} != 0)))}
8236 \def\bbl@cs@jd#1#2#3{% year, month, day
8237   \fp_eval:n{ 1721424.5 + (365 * (#1 - 1)) +
8238     floor((#1 - 1) / 4) + (-floor((#1 - 1) / 100)) +
8239     floor((#1 - 1) / 400) + floor(((367 * #2) - 362) / 12) +
8240     ((#2 <= 2) ? 0 : (\bbl@cs@gregleap{#1} ? -1 : -2)) + #3 } }
8241 <</Compute Julian day>>

```

### 13.1 Islamic

The code for the Civil calendar is based on it, too.

```

8242 <*ca-islamic>
8243 \ExplSyntaxOn
8244 <@Compute Julian day@>
8245 % == islamic (default)
8246 % Not yet implemented
8247 \def\bbl@ca@islamic#1-#2-#3\@@#4#5#6{}

```

The Civil calendar:

```

8248 \def\bbl@cs@isltojd#1#2#3{ % year, month, day
8249   ((#3 + ceil(29.5 * (#2 - 1)) +
8250     (#1 - 1) * 354 + floor((3 + (11 * #1)) / 30) +
8251     1948439.5) - 1) }
8252 \@namedef{bbl@ca@islamic-civil++}{\bbl@ca@islamicvl@x{+2}}

### 13.3 Persian

There is an algorithm written in TeX by Jabri, Abolhassani, Pournader and Esfahbod, created for the first versions of the FarsiTeX system (no longer available), but the original license is GPL, so its use with LPL is problematic. The code here follows loosely that by John Walker, which is free and accurate, but sadly very complex, so the relevant data for the years 2013-2050 have been pre-calculated and stored. Actually, all we need is the first day (either March 20 or March 21).

```

## 14 Support for Plain T<sub>E</sub>X (plain.def)

### 14.1 Not renaming hyphen.tex

As Don Knuth has declared that the filename `hyphen.tex` may only be used to designate *his* version of the american English hyphenation patterns, a new solution has to be found in order to be able to load hyphenation patterns for other languages in a plain-based T<sub>E</sub>X-format. When asked he responded:

That file name is “sacred”, and if anybody changes it they will cause severe upward/downward compatibility headaches.

People can have a file `localhyphen.tex` or whatever they like, but they mustn’t diddle with `hyphen.tex` (or `plain.tex` except to preload additional fonts).

The files `bplain.tex` and `blplain.tex` can be used as replacement wrappers around `plain.tex` and `lplain.tex` to achieve the desired effect, based on the `babel` package. If you load each of them with `iniTEX`, you will get a file called either `bplain.fmt` or `blplain.fmt`, which you can use as replacements for `plain.fmt` and `lplain.fmt`.

As these files are going to be read as the first thing `iniTEX` sees, we need to set some category codes just to be able to change the definition of `\input`.

```

8713 \bplain | blplain
8714 \catcode`\{=1 % left brace is begin-group character
8715 \catcode`\}=2 % right brace is end-group character
8716 \catcode`\#=6 % hash mark is macro parameter character

```

If a file called `hyphen.cfg` can be found, we make sure that *it* will be read instead of the file `hyphen.tex`. We do this by first saving the original meaning of `\input` (and I use a one letter control sequence for that so as not to waste multi-letter control sequence on this in the format).

```
8717 \openin 0 hyphen.cfg
8718 \ifeof0
8719 \else
8720 \let\input
```

Then `\input` is defined to forget about its argument and load `hyphen.cfg` instead. Once that's done the original meaning of `\input` can be restored and the definition of `\a` can be forgotten.

```
8721 \def\input #1 {%
8722 \let\input\input
8723 \a hyphen.cfg
8724 \let\input\input
8725 }
8726 \fi
8727 \bblatex\blatex
```

Now that we have made sure that `hyphen.cfg` will be loaded at the right moment it is time to load `plain.tex`.

```
8728 \bblatex\input plain.tex
8729 \bblatex\input lplain.tex
```

Finally we change the contents of `\fmtname` to indicate that this is *not* the plain format, but a format based on plain with the `babel` package preloaded.

```
8730 \bblatex\def\fmtname{babel-plain}
8731 \bblatex\def\fmtname{babel-lplain}
```

When you are using a different format, based on `plain.tex` you can make a copy of `blplain.tex`, rename it and replace `plain.tex` with the name of your format file.

## 14.2 Emulating some $\text{\LaTeX}$ features

The file `babel.def` expects some definitions made in the  $\text{\LaTeX} 2_{\epsilon}$  style file. So, in Plain we must provide at least some predefined values as well some tools to set them (even if not all options are available). There are no package options, and therefore an alternative mechanism is provided. For the moment, only `\babeloptionstrings` and `\babeloptionmath` are provided, which can be defined before loading `babel`. `\BabelModifiers` can be set too (but not sure it works).

```
8732 \bblatex\def\EmulateLaTeX{\bblatex}
8733 \def\@empty{}
8734 \def\loadlocalcfg#1{%
8735 \openin0#1.cfg

8892 \def\@x@protect#1&fi#2#3{&fi\protect#1}

```

The following little macro `\in@` is taken from `latex.ltx`; it checks whether its first argument is part of its second argument. It uses the boolean `\in@`; allocating a new boolean inside conditionally executed code is not possible, hence the construct with the temporary definition of `\bbl@tempa`.

```

8893 \def\bbl@tempa{\csname newif\endcsname&ifin@}
8894 \catcode`\&=4
8895 \ifx\in@\@undefined

8900 \else
8901     \let\bbl@tempa\@empty
8902 \fi
8903 \bbl@tempa

```

$\text{\LaTeX}$  has a macro to check whether a certain package was loaded with specific options. The command has two extra arguments which are code to be executed in either the true or false case. This is used to detect whether the document needs one of the accents to be activated (`activegrave` and `activeacute`). For plain  $\text{\TeX}$  we assume that the user wants them to be active by default. Therefore the only thing we do is execute the third argument (the code for the true case).

```

8904 \def\@ifpackagewith#1#2#3#4{#3}

```

The  $\text{\LaTeX}$  macro `\@ifl@aded` checks whether a file was loaded. This functionality is not needed for plain  $\text{\TeX}$  but we need the macro to be defined as a no-op.

```

8905 \def\@ifl@aded#1#2#3#4{}

```

For the following code we need to make sure that the commands `\newcommand` and `\providecommand` exist with some sensible definition. They are not fully equivalent to their  $\text{\LaTeX 2}_{\epsilon}$  versions; just enough to make things work in plain  $\text{\TeX}$  environments.

```

8906 \ifx\@tempcnta\@undefined
8907     \csname newcount\endcsname\@tempcnta\relax
8908 \fi
8909 \ifx\@tempcntb\@undefined
8910     \csname newcount\endcsname\@tempcntb\relax
8911 \fi

```

To prevent wasting two counters in  $\text{\TeX}$  (because counters with the same name are allocated later by it) we reset the counter that holds the next free counter (`\count10`).

```

9063 \def\cf@encoding{OT1}

```

Currently we only use the  $\text{\LaTeX 2 $\epsilon$ }$  method for accents for those that are known to be made active in *some* language definition file.

```

9064 \DeclareTextAccent{"}{OT1}{127}
9065 \DeclareTextAccent{'}{OT1}{19}
9066 \DeclareTextAccent{^}{OT1}{94}
9067 \DeclareTextAccent{\`}{OT1}{18}
9068 \DeclareTextAccent{\~}{OT1}{126}

```

The following control sequences are used in `babel.def` but are not defined for PLAIN  $\text{\TeX}$ .

```

9069 \DeclareTextSymbol{\textquotedblleft}{OT1}{92}
9070 \DeclareTextSymbol{\textquotedblright}{OT1}{`\`}
9071 \DeclareTextSymbol{\textquoteleft}{OT1}{``}
9072 \DeclareTextSymbol{\textquoteright}{OT1}{``'}
9073 \DeclareTextSymbol{\i}{OT1}{16}
9074 \DeclareTextSymbol{\ss}{OT1}{25}

```

For a couple of languages we need the  $\text{\LaTeX}$ -control sequence `\scriptsize` to be available. Because plain  $\text{\TeX}$  doesn't have such a sophisticated font mechanism as  $\text{\LaTeX}$  has, we just `\let` it to `\sevenrm`.

```

9075 \ifx\scriptsize\@undefined
9076   \let\scriptsize\sevenrm
9077 \fi

```

And a few more “dummy” definitions.

```

9078 \def\language{english}%
9079 \let\bbl@opt@shorthands\@nnil
9080 \def\bbl@ifshorthand#1#2#3{#2}%

9100 \expandafter\newif\csname ifbbl@single\endcsname
9101 \chardef\bbl@bidimode\z@
9102 <</Emulate LaTeX>>

```

A proxy file:

```

9103 <*\plain>
9104 \input babel.def
9105 </\plain>

```

## 15 Acknowledgements

In the initial stages of the development of babel, Bernd Raichle provided many helpful suggestions and Michel Goossens supplied contributions for many languages. Ideas from Nico Poppelier, Piet van Oostrum and many others have been used. Paul Wackers and Werenfried Spit helped find and repair bugs.

More recently, there are significant contributions by Salim Bou, Ulrike Fischer and Udi Fogiel. There are also many contributors for specific languages, which are mentioned in the respective files. Without them, babel just wouldn't exist.
