The babel package is being developed incrementally, which means parts of the code are under development and therefore incomplete. Only documented features are considered complete. In other words, use babel in real documents only as documented (except, of course, if you want to explore and test them).

1. Identification and loading of required files

The babel package after unpacking consists of the following files:

babel.sty is the \LaTeX package, which set options and load language styles.

babel.def is loaded by Plain.

switch.def defines macros to set and switch languages (it loads part babel.def).

plain.def is not used, and just loads babel.def, for compatibility.

hyphen.cfg is the file to be used when generating the formats to load hyphenation patterns.

There some additional tex, def and lua files.

The babel installer extends docstrip with a few “pseudo-guards” to set “variables” used at installation time. They are used with `<@name@>` at the appropriate places in the source code and defined with either `<<name=value>>`, or with a series of lines between `<<*name>>` and `<</name>>`. The latter is cumulative (eg, with *More package options*). That brings a little bit of literate programming. The guards `<-name>` and `<+name>` have been redefined, too. See babel.ins for further details.

2. locale directory

A required component of babel is a set of ini files with basic definitions for about 300 languages. They are distributed as a separate zip file, not packed as dtx. Many of them are essentially finished (except bugs and mistakes, of course). Some of them are still incomplete (but they will be usable), and there are some omissions (eg, there are no geographic areas in Spanish). Not all include LICR variants.

babel-*.ini files contain the actual data; babel-*.tex files are basically proxies to the corresponding ini files.

See [Keys in ini files](#) in the the babel site.

3. Tools

```
1 <<version=24.11.65838>>
2 <<date=2024/10/19>>
```

Do not use the following macros in ldf files. They may change in the future. This applies mainly to those recently added for replacing, trimming and looping. The older ones, like `\bbl@afterfi`, will not change. We define some basic macros which just make the code cleaner. `\bbl@add` is now used internally instead of `\addto` because of the unpredictable behavior of the latter. Used in babel.def and in babel.sty, which means in \LaTeX is executed twice, but we need them when defining options and babel.def cannot be load until options have been defined. This does not hurt, but should be fixed somehow.

```
3 <<*Basic macros>> ≡
4 \bbl@trace{Basic macros}
5 \def\bbl@stripslash{\expandafter\@gobble\string}
6 \def\bbl@add#1#2{%
7   \bbl@ifunset{\bbl@stripslash#1}%
8     {\def#1{#2}}%
9     {\expandafter\def\expandafter#1\expandafter{#1#2}}
10 \def\bbl@xin@{\@expandtwoargs\in@}
11 \def\bbl@carg#1#2{\expandafter#1\csname#2\endcsname}%
12 \def\bbl@ncarg#1#2#3{\expandafter#1\expandafter#2\csname#3\endcsname}%
13 \def\bbl@ccarg#1#2#3{%
14   \expandafter#1\csname#2\expandafter\endcsname\csname#3\endcsname}%
15 \def\bbl@carg#1#2{\expandafter#1\csname bbl@#2\endcsname}%
16 \def\bbl@cs#1{\csname bbl@#1\endcsname}
17 \def\bbl@c#1#1{\csname bbl@#1\language\endcsname}
18 \def\bbl@loop#1#2#3{\bbl@loop#1{#3}#2,\@nnil,}
19 \def\bbl@loopx#1#2{\expandafter\bbl@loop\expandafter#1\expandafter{#2}}
```

```

20 \def\bbl@loop#1#2#3,{%
21   \ifx\@nnil#3\relax\else
22     \def#1{#3}#2\bbl@afterfi\bbl@loop#1{#2}%
23   \fi}
24 \def\bbl@for#1#2#3{\bbl@loopx#1{#2}{\ifx#1\@empty\else#3\fi}}

```

\bbl@add@list This internal macro adds its second argument to a comma separated list in its first argument. When the list is not defined yet (or empty), it will be initiated. It presumes expandable character strings.

```

25 \def\bbl@add@list#1#2{%
26   \edef#1{%
27     \bbl@ifunset{\bbl@stripslash#1}%
28     }%
29     {\ifx#1\@empty\else#1,\fi}%
30   #2}}

```

\bbl@afterelse

\bbl@afterfi Because the code that is used in the handling of active characters may need to look ahead, we take extra care to ‘throw’ it over the `\else` and `\fi` parts of an `\if`-statement¹. These macros will break if another `\if... \fi` statement appears in one of the arguments and it is not enclosed in braces.

```

31 \long\def\bbl@afterelse#1\else#2\fi{\fi#1}
32 \long\def\bbl@afterfi#1\fi{\fi#1}

```

\bbl@exp Now, just syntactical sugar, but it makes partial expansion of some code a lot more simple and readable. Here `\` stands for `\noexpand`, `\<.` for `\noexpand` applied to a built macro name (which does not define the macro if undefined to `\relax`, because it is created locally), and `\[. . .]` for one-level expansion (where `. . .` is the macro name without the backslash). The result may be followed by extra arguments, if necessary.

```

33 \def\bbl@exp#1{%
34   \begingroup
35   \let\<\noexpand
36   \let\<\bbl@exp@en
37   \let\[\bbl@exp@ue
38   \edef\bbl@exp@aux{\endgroup#1}%
39   \bbl@exp@aux}
40 \def\bbl@exp@en#1>{\expandafter\noexpand\csname#1\endcsname}%
41 \def\bbl@exp@ue#1]{%
42   \unexpanded\expandafter\expandafter\expandafter{\csname#1\endcsname}}%

```

\bbl@trim The following piece of code is stolen (with some changes) from `keyval`, by David Carlisle. It defines two macros: `\bbl@trim` and `\bbl@trim@def`. The first one strips the leading and trailing spaces from the second argument and then applies the first argument (a macro, `\toks@` and the like). The second one, as its name suggests, defines the first argument as the stripped second argument.

```

43 \def\bbl@tempa#1{%
44   \long\def\bbl@trim##1##2{%
45     \futurelet\bbl@trim@a\bbl@trim@c##2\@nil\@nil#1\@nil\relax{##1}}%
46   \def\bbl@trim@c{%
47     \ifx\bbl@trim@a\@sptoken
48       \expandafter\bbl@trim@b
49     \else
50       \expandafter\bbl@trim@b\expandafter#1%
51     \fi}%
52   \long\def\bbl@trim@b#1##1 \@nil{\bbl@trim@i##1}}
53 \bbl@tempa{ }
54 \long\def\bbl@trim@i#1\@nil#2\relax#3{#3{#1}}
55 \long\def\bbl@trim@def#1{\bbl@trim{\def#1}}

```

¹This code is based on code presented in TUGboat vol. 12, no2, June 1991 in “An expansion Power Lemma” by Sonja Maus.

\bbl@ifunset To check if a macro is defined, we create a new macro, which does the same as \ifundefined. However, in an ϵ -tex engine, it is based on \ifcename, which is more efficient, and does not waste memory. Defined inside a group, to avoid \ifcename being implicitly set to \relax by the \cename test.

```

56 \begingroup
57 \gdef\bbl@ifunset#1{%
58   \expandafter\ifx\cename#1\endcename\relax
59   \expandafter\@firstoftwo
60   \else
61   \expandafter\@secondoftwo
62   \fi}
63 \bbl@ifunset{ifcename}%
64 {}%
65 {\gdef\bbl@ifunset#1{%
66   \ifcename#1\endcename
67   \expandafter\ifx\cename#1\endcename\relax
68   \bbl@afterelse\expandafter\@firstoftwo
69   \else
70   \bbl@afterfi\expandafter\@secondoftwo
71   \fi
72   \else
73   \expandafter\@firstoftwo
74   \fi}}
75 \endgroup

```

\bbl@ifblank A tool from url, by Donald Arseneau, which tests if a string is empty or space. The companion macros tests if a macro is defined with some ‘real’ value, ie, not \relax and not empty,

```

76 \def\bbl@ifblank#1{%
77   \bbl@ifblank@i#1\@nil\@nil\@secondoftwo\@firstoftwo\@nil}
78 \long\def\bbl@ifblank@i#1#2\@nil#3#4#5\@nil{#4}
79 \def\bbl@ifset#1#2#3{%
80   \bbl@ifunset{#1}{#3}{\bbl@exp{\bbl@ifblank{\@nameuse{#1}}}{#3}{#2}}}

```

For each element in the comma separated <key>=<value> list, execute <code> with #1 and #2 as the key and the value of current item (trimmed). In addition, the item is passed verbatim as #3. With the <key> alone, it passes \empty (ie, the macro thus named, not an empty argument, which is what you get with <key>= and no value).

```

81 \def\bbl@forkv#1#2{%
82   \def\bbl@kvcmd##1##2##3{#2}%
83   \bbl@kvnext#1,\@nil,}
84 \def\bbl@kvnext#1,{%
85   \ifx\@nil#1\relax\else
86   \bbl@ifblank{#1}{\bbl@forkv@eq#1=\@empty=\@nil{#1}}%
87   \expandafter\bbl@kvnext
88   \fi}
89 \def\bbl@forkv@eq#1=#2=#3\@nil#4{%
90   \bbl@trim\def\bbl@forkv@a{#1}%
91   \bbl@trim{\expandafter\bbl@kvcmd\expandafter{\bbl@forkv@a}}{#2}{#4}}

```

A for loop. Each item (trimmed) is #1. It cannot be nested (it’s doable, but we don’t need it).

```

92 \def\bbl@vforeach#1#2{%
93   \def\bbl@forcmd##1{#2}%
94   \bbl@fornext#1,\@nil,}
95 \def\bbl@fornext#1,{%
96   \ifx\@nil#1\relax\else
97   \bbl@ifblank{#1}{\bbl@trim\bbl@forcmd{#1}}%
98   \expandafter\bbl@fornext
99   \fi}
100 \def\bbl@foreach#1{\expandafter\bbl@vforeach\expandafter{#1}}

```

\bbl@replace Returns implicitly \toks@ with the modified string.

```

101 \def\bbl@replace#1#2#3{% in #1 -> repl #2 by #3

```

```

102 \toks@{}%
103 \def\bbl@replace@aux##1#2##2#2{%
104   \ifx\bbl@nil##2%
105     \toks@\expandafter{\the\toks@##1}%
106   \else
107     \toks@\expandafter{\the\toks@##1#3}%
108     \bbl@afterfi
109     \bbl@replace@aux##2#2%
110   \fi}%
111 \expandafter\bbl@replace@aux#1#2\bbl@nil#2%
112 \edef#1{\the\toks@}

```

An extension to the previous macro. It takes into account the parameters, and it is string based (ie, if you replace elax by ho, then \relax becomes \rho). No checking is done at all, because it is not a general purpose macro, and it is used by babel only when it works (an example where it does *not* work is in \bbl@TG@@date, and also fails if there are macros with spaces, because they are retokenized). It may change! (or even merged with \bbl@replace; I'm not sure checking the replacement is really necessary or just paranoia).

```

113 \ifx\detokenize\undefined\else % Unused macros if old Plain TeX
114   \bbl@exp{\def\\bbl@parsedef##1\detokenize{macro:}}#2->#3\relax}%
115   \def\bbl@tempa{#1}%
116   \def\bbl@tempb{#2}%
117   \def\bbl@tempe{#3}}
118 \def\bbl@sreplace#1#2#3{%
119   \begingroup
120     \expandafter\bbl@parsedef\meaning#1\relax
121     \def\bbl@tempc{#2}%
122     \edef\bbl@tempc{\expandafter\strip@prefix\meaning\bbl@tempc}%
123     \def\bbl@tempd{#3}%
124     \edef\bbl@tempd{\expandafter\strip@prefix\meaning\bbl@tempd}%
125     \bbl@xin{\bbl@tempc}{\bbl@tempe}% If not in macro, do nothing
126     \ifin@
127       \bbl@exp{\\bbl@replace\\bbl@tempe{\bbl@tempc}{\bbl@tempd}}%
128       \def\bbl@tempc%      Expanded an executed below as 'uplevel'
129       \\makeatletter % "internal" macros with @ are assumed
130       \\scantokens{%
131         \bbl@tempa\\@namedef{\bbl@stripslash#1}\bbl@tempb{\bbl@tempe}}%
132       \catcode64=\the\catcode64\relax}% Restore @
133   \else
134     \let\bbl@tempc\empty % Not \relax
135   \fi
136   \bbl@exp{%      For the 'uplevel' assignments
137   \endgroup
138   \bbl@tempc}} % empty or expand to set #1 with changes
139 \fi

```

Two further tools. \bbl@ifsamestring first expand its arguments and then compare their expansion (sanitized, so that the catcodes do not matter). \bbl@engine takes the following values: 0 is pdfTeX, 1 is luatex, and 2 is xetex. You may use the latter it in your language style if you want.

```

140 \def\bbl@ifsamestring#1#2{%
141   \begingroup
142     \protected@edef\bbl@tempb{#1}%
143     \edef\bbl@tempb{\expandafter\strip@prefix\meaning\bbl@tempb}%
144     \protected@edef\bbl@tempc{#2}%

150     \fi
151   \endgroup}
152 \chardef\bbl@engine=
153 \ifx\directlua\undefined
154   \ifx\XeTeXinputencoding\undefined

```

```

155     \z@
156   \else
157     \tw@
158   \fi
159 \else
160   \@ne
161 \fi

```

A somewhat hackish tool (hence its name) to avoid spurious spaces in some contexts.

```

162 \def\bbl@bsphack{%
163   \ifhmode
164     \hskip\z@skip
165   \def\bbl@esphack{\loop\ifdim\lastskip>\z@\unskip\repeat\unskip}%
166   \else
167     \let\bbl@esphack\@empty
168   \fi}

```

Another hackish tool, to apply case changes inside a protected macros. It's based on the internal `\let`'s made by `\MakeUppercase` and `\MakeLowercase` between things like `\oe` and `\OE`.

```

169 \def\bbl@cased{%
170   \ifx\oe\OE
171     \expandafter\in@\expandafter
172       {\expandafter\OE\expandafter}\expandafter{\oe}%
173   \ifin@
174     \bbl@afterelse\expandafter\MakeUppercase
175   \else
176     \bbl@afterfi\expandafter\MakeLowercase
177   \fi
178 \else
179   \expandafter\@firstofone
180 \fi}

```

The following adds some code to `\extras...` both before and after, while avoiding doing it twice. It's somewhat convoluted, to deal with `#`'s. Used to deal with `alph`, `Alph` and frenchspacing when there are already changes (with `\babel@save`).

```

181 \def\bbl@extras@wrap#1#2#3{% 1:in-test, 2:before, 3:after
182   \toks@\expandafter\expandafter\expandafter{%
183     \csname extras\language\endcsname}%
184   \bbl@exp{\in@{#1}{\the\toks@}}%
185   \ifin@\else
186     \@temptokena{#2}%
187     \edef\bbl@tempc{\the\@temptokena\the\toks@}%
188     \toks@\expandafter{\bbl@tempc#3}%
189     \expandafter\edef\csname extras\language\endcsname{\the\toks@}%
190   \fi}
191 <</Basic macros>>

```

Some files identify themselves with a \TeX macro. The following code is placed before them to define (and then undefine) if not in \TeX .

```

192 <<*Make sure ProvidesFile is defined>> ≡
193 \ifx\ProvidesFile\@undefined
194   \def\ProvidesFile#1[#2 #3 #4]{%
195     \wlog{File: #1 #4 #3 <#2>}%
196     \let\ProvidesFile\@undefined}
197 \fi
198 <</Make sure ProvidesFile is defined>>

```

3.1. A few core definitions

Language Just for compatibility, for not to touch `hyphen.cfg`.

```

199 <<*Define core switching macros>> ≡
200 \ifx\language\@undefined
201   \csname newcount\endcsname\language
202 \fi
203 <</Define core switching macros>>

```

\last@language Another counter is used to keep track of the allocated languages. \TeX and \LaTeX reserves for this purpose the count 19.

\addlanguage This macro was introduced for $\TeX < 2$. Preserved for compatibility.

```
204 <<*Define core switching macros>> ≡
205 \countdef\last@language=19
206 \def\addlanguage{\csname newlanguage\endcsname}
207 <</Define core switching macros>>
```

Now we make sure all required files are loaded. When the command `\AtBeginDocument` doesn't exist we assume that we are dealing with a plain-based format. In that case the file `plain.def` is needed (which also defines `\AtBeginDocument`, and therefore it is not loaded twice). We need the first part when the format is created, and `\orig@dump` is used as a flag. Otherwise, we need to use the second part, so `\orig@dump` is not defined (`plain.def` undefines it).

Check if the current version of `switch.def` has been previously loaded (mainly, `hyphen.cfg`). If not, load it now. We cannot load `babel.def` here because we first need to declare and process the package options.

3.2. \LaTeX : `babel.sty` (start)

Here starts the style file for \LaTeX . It also takes care of a number of compatibility issues with other packages.

```
208 <*package>
209 \NeedsTeXFormat{LaTeX2e}[2005/12/01]
210 \ProvidesPackage{babel}[<@date@> v<@version@> The Babel package]
```

Start with some “private” debugging tools, and then define macros for errors. The global lua ‘space’ Babel is declared here, too (inside the test for debug).

```
211 \ifpackagewith{babel}{debug}
212 {\providecommand\bbl@trace[1]{\message{^^J[ #1 ]}}%
213 \let\bbl@debug\@firstofone
214 \ifx\directlua\@undefined\else
215 \directlua{
216 Babel = Babel or {}
217 Babel.debug = true }%
218 \input{babel-debug.tex}%
219 \fi}
220 {\providecommand\bbl@trace[1]{}%
221 \let\bbl@debug\@gobble
222 \ifx\directlua\@undefined\else
223 \directlua{
224 Babel = Babel or {}
225 Babel.debug = false }%
226 \fi}
```

Macros to deal with errors, warnings, etc. Errors are stored in a separate file.

```
227 \def\bbl@error#1{% Implicit #2#3#4
228 \begingroup
229 \catcode`\=0 \catcode`\==12 \catcode`\`=12
230 \input errbabel.def
231 \endgroup
232 \bbl@error{#1}}
233 \def\bbl@warning#1{%
234 \begingroup
235 \def\{\{MessageBreak}%
236 \PackageWarning{babel}{#1}%
237 \endgroup}
238 \def\bbl@infowarn#1{%
239 \begingroup
240 \def\{\{MessageBreak}%
241 \PackageNote{babel}{#1}%
242 \endgroup}
243 \def\bbl@info#1{%
```

```

244 \begingroup
245   \def\{\MessageBreak}%
246   \PackageInfo{babel}{#1}%
247 \endgroup

```

Many of the following options don't do anything themselves, they are just defined in order to make it possible for babel and language definition files to check if one of them was specified by the user.

But first, include here the *Basic macros* defined above.

```

248 <@Basic macros>
249 \ifpackagewith{babel}{silent}
250   {\let\bbl@info\@gobble
251    \let\bbl@infowarn\@gobble
252    \let\bbl@warning\@gobble}
253   {}
254 %
255 \def\AfterBabelLanguage#1{%
256   \global\expandafter\bbl@add\csname#1.ldf-h@k\endcsname}%

```

If the format created a list of loaded languages (in `\bbl@languages`), get the name of the 0-th to show the actual language used. Also available with base, because it just shows info.

```

257 \ifx\bbl@languages\undefined\else

```

3.3. base

The first 'real' option to be processed is base, which set the hyphenation patterns then resets `ver@babel.sty` so that \TeX forgets about the first loading. After a subset of `babel.def` has been loaded (the old `switch.def`) and `\AfterBabelLanguage` defined, it exits.

Now the base option. With it we can define (and load, with `luatex`) hyphenation patterns, even if we are not interested in the rest of babel.

```

275 \bbl@trace{Defining option 'base'}
276 \ifpackagewith{babel}{base}{%
277   \let\bbl@onlyswitch\@empty

```

3.4. key=value options and other general option

The following macros extract language modifiers, and only real package options are kept in the option list. Modifiers are saved and assigned to `\BabelModifiers` at `\bbl@load@language`; when no modifiers have been given, the former is `\relax`.

```

295 \bbl@trace{key=value and another general options}
296 \bbl@csarg\let{tempa\expandafter}\csname opt@babel.sty\endcsname
297 \def\bbl@tempb#1.#2{% Remove trailing dot

322     \fi
323   \fi}
324 \let\bbl@tempc\@empty
325 \bbl@foreach\bbl@tempa{\bbl@tempd#1.\@empty\@nnil}
326 \expandafter\let\csname opt@babel.sty\endcsname\bbl@tempc

```

The next option tells babel to leave shorthand characters active at the end of processing the package. This is *not* the default as it can cause problems with other packages, but for those who want to use the shorthand characters in the preamble of their documents this can help.

```

327 \DeclareOption{KeepShorthandsActive}{}
328 \DeclareOption{activeacute}{}
329 \DeclareOption{activegrave}{}
330 \DeclareOption{debug}{}
331 \DeclareOption{noconfigs}{}
332 \DeclareOption{showlanguages}{}
333 \DeclareOption{silent}{}
334 \DeclareOption{shorthands=off}{\bbl@tempa shorthands=\bbl@tempa}
335 \chardef\bbl@iniflag\z@
336 \DeclareOption{provide=*}{\chardef\bbl@iniflag\@ne} % main -> +1
337 \DeclareOption{provide+=*}{\chardef\bbl@iniflag\tw@} % second = 2
338 \DeclareOption{provide*=*}{\chardef\bbl@iniflag\thr@@} % second + main
339 % A separate option
340 \let\bbl@autoload@options\@empty
341 \DeclareOption{provide=*}{\def\bbl@autoload@options{import}}
342 % Don't use. Experimental. TODO.
343 \newif\ifbbl@single
344 \DeclareOption{selectors=off}{\bbl@singletrue}

```

```
345 <@More package options>
```

Handling of package options is done in three passes. (I [JBL] am not very happy with the idea, anyway.) The first one processes options which has been declared above or follow the syntax $\langle key \rangle = \langle value \rangle$, the second one loads the requested languages, except the main one if set with the key main, and the third one loads the latter. First, we “flag” valid keys with a nil value.

```
346 \let\bbl@opt@shorthands\@nnil
347 \let\bbl@opt@config\@nnil
348 \let\bbl@opt@main\@nnil
349 \let\bbl@opt@headfoot\@nnil
350 \let\bbl@opt@layout\@nnil
351 \let\bbl@opt@provide\@nnil
```

The following tool is defined temporarily to store the values of options.

```
352 \def\bbl@tempa#1=#2\bbl@tempa{%
353   \bbl@csarg\ifx{opt@#1}\@nnil
354   \bbl@csarg\edef{opt@#1}{#2}%
355   \else
356   \bbl@error{bad-package-option}{#1}{#2}{}%
357   \fi}
```

Now the option list is processed, taking into account only currently declared options (including those declared with a =), and $\langle key \rangle = \langle value \rangle$ options (the former take precedence). Unrecognized options are saved in `\bbl@language@opts`, because they are language options.

```
358 \let\bbl@language@opts\@empty
359 \DeclareOption*{%
360   \bbl@xin@{\string=}{\CurrentOption}%
361   \ifin@
362   \expandafter\bbl@tempa\CurrentOption\bbl@tempa
363   \else
364   \bbl@add@list\bbl@language@opts{\CurrentOption}%
365   \fi}
```

Now we finish the first pass (and start over).

```
366 \ProcessOptions*
```

3.5. Post-process some options

```
367 \ifx\bbl@opt@provide\@nnil
368   \let\bbl@opt@provide\@empty % %%% MOVE above
369 \else
370   \chardef\bbl@iniflag\@ne
371   \bbl@exp{\bbl@forkv{\@nameuse{@raw@opt@babel.sty}}}{%

429 \else
430 \expandafter\@secondoftwo
431 \fi}
432 \fi
433 </package>

```

3.6. Plain: babel.def (start)

Because of the way docstrip works, we need to insert some code for Plain here. However, the tools provided by the babel installer for literate programming makes this section a short interlude, because the actual code is below, tagged as *Emulate LaTeX*.

First, exit immediately if previously loaded.

```
434 \<core>
435 \ifx\ldf@quit\undefined\else
436 \endinput\fi % Same line!
437 <@Make sure ProvidesFile is defined>
438 \ProvidesFile{babel.def}[<@date> v<@version> Babel common definitions]
439 \ifx\AtBeginDocument\undefined %^^A TODO. change test.
440 <@Emulate LaTeX>
441 \fi
442 <@Basic macros>
443 \</core>
```

That is all for the moment. Now follows some common stuff, for both Plain and \LaTeX . After it, we will resume the \LaTeX -only stuff.

4. babel.sty and babel.def (common)

```
444 \<package | core>
445 \def\bbl@version{<@version>}
446 \def\bbl@date{<@date>}
447 <@Define core switching macros>
```

\adddialect The macro `\adddialect` can be used to add the name of a dialect or variant language, for which an already defined hyphenation table can be used.

```
448 \def\adddialect#1#2{%
449   \global\chardef#1#2\relax

460           \fi}%
461         \bbl@cs{languages}%
462         \endgroup}
```

`\bbl@iflanguage` executes code only if the language `l@` exists. Otherwise raises an error.

The argument of `\bbl@fixname` has to be a macro name, as it may get “fixed” if casing (lc/uc) is wrong. It’s an attempt to fix a long-standing bug when `\foreignlanguage` and the like appear in a `\MakeXXXcase`. However, a lowercase form is not imposed to improve backward compatibility (perhaps you defined a language named MYLANG, but unfortunately mixed case names cannot be trapped). Note `l@` is encapsulated, so that its case does not change.

```
463 \def\bbl@fixname#1{%

```

After a name has been ‘fixed’, the selectors will try to load the language. If even the fixed name is not defined, will load it on the fly, either based on its name, or if activated, its BCP47 code.

We first need a couple of macros for a simple BCP 47 look up. It also makes sure, with `\bbl@bcpcase`, casing is the correct one, so that `sr-latn-ba` becomes `fr-Latn-BA`. Note #4 may contain some `\empty`’s, but they are eventually removed. `\bbl@bcpllookup` either returns the found `ini` or it is `\relax`.

```

```

\iflanguage Users might want to test (in a private package for instance) which language is currently active. For this we provide a test macro, `\iflanguage`, that has three arguments. It checks whether the first argument is a known language. If so, it compares the first argument with the value of `\language`. Then, depending on the result of the comparison, it executes either the second or the third argument.

```

522 \def\iflanguage#1{%
523 \bbl@iflanguage{#1}{%
524 \ifnum\cscname{l@#1}\endcsname=\language

```

```

525     \expandafter\@firstoftwo
526     \else
527     \expandafter\@secondoftwo
528     \fi}}

```

4.1. Selecting the language

\selectlanguage It checks whether the language is already defined before it performs its actual task, which is to update `\language` and activate language-specific definitions.

```

529 \let\bbl@select@type\z@
530 \edef\selectlanguage{%
531     \noexpand\protect
532     \expandafter\noexpand\csname selectlanguage \endcsname}

```

Because the command `\selectlanguage` could be used in a moving argument it expands to `\protect\selectlanguage_`. Therefore, we have to make sure that a macro `\protect` exists. If it doesn't it is `\let to \relax`.

```

533 \ifx\@undefined\protect\let\protect\relax\fi

```

The following definition is preserved for backwards compatibility (eg, arabi, koma). It is related to a trick for 2.09, now discarded.

```

534 \let\xstring\string

```

Since version 3.5 babel writes entries to the auxiliary files in order to typeset table of contents etc. in the correct language environment.

\bbl@pop@language But when the language change happens *inside* a group the end of the group doesn't write anything to the auxiliary files. Therefore we need TeX's `aftergroup` mechanism to help us. The command `\aftergroup` stores the token immediately following it to be executed when the current group is closed. So we define a temporary control sequence `\bbl@pop@language` to be executed at the end of the group. It calls `\bbl@set@language` with the name of the current language as its argument.

\bbl@language@stack The previous solution works for one level of nesting groups, but as soon as more levels are used it is no longer adequate. For that case we need to keep track of the nested languages using a stack mechanism. This stack is called `\bbl@language@stack` and initially empty.

```

535 \def\bbl@language@stack{}

```

When using a stack we need a mechanism to push an element on the stack and to retrieve the information afterwards.

\bbl@push@language

\bbl@pop@language The stack is simply a list of languagenames, separated with a '+' sign; the push function can be simple:

```

536 \def\bbl@push@language{%
537     \ifx\language\@undefined\else
538     \ifx\currentgrouplevel\@undefined
539     \xdef\bbl@language@stack{\language+\bbl@language@stack}%
540     \else
541     \ifnum\currentgrouplevel=\z@
542     \xdef\bbl@language@stack{\language+}%
543     \else
544     \xdef\bbl@language@stack{\language+\bbl@language@stack}%
545     \fi
546     \fi
547     \fi}

```

Retrieving information from the stack is a little bit less simple, as we need to remove the element from the stack while storing it in the macro `\language`. For this we first define a helper function.

\bbl@pop@lang This macro stores its first element (which is delimited by the ‘+’-sign) in \language and stores the rest of the string in \bbl@language@stack.

```
548 \def\bbl@pop@lang#1+#2\@@{%
549   \edef\language{\language#1}%
550   \xdef\bbl@language@stack{#2}}
```

The reason for the somewhat weird arrangement of arguments to the helper function is the fact it is called in the following way. This means that before \bbl@pop@lang is executed TeX first *expands* the stack, stored in \bbl@language@stack. The result of that is that the argument string of \bbl@pop@lang contains one or more language names, each followed by a ‘+’-sign (zero language names won’t occur as this macro will only be called after something has been pushed on the stack).

```
551 \let\bbl@ifrestoring\@secondoftwo
552 \def\bbl@pop@language{%
553   \expandafter\bbl@pop@lang\bbl@language@stack\@@
554   \let\bbl@ifrestoring\@firstoftwo
555   \expandafter\bbl@set@language\expandafter{\language}%
556   \let\bbl@ifrestoring\@secondoftwo}
```

Once the name of the previous language is retrieved from the stack, it is fed to \bbl@set@language to do the actual work of switching everything that needs switching.

An alternative way to identify languages (in the babel sense) with a numerical value is introduced in 3.30. This is one of the first steps for a new interface based on the concept of locale, which explains the name of \localeid. This means \l@. . . will be reserved for hyphenation patterns (so that two locales can share the same rules).

```
557 \chardef\localeid\z@
558 \def\bbl@id@last{0} % No real need for a new counter
559 \def\bbl@id@assign{%
560   \bbl@ifunset{bbl@id@\language}%
561   {\count@bbl@id@last\relax
562     \advance\count@\@ne
563     \bbl@csarg\chardef{id@\language}\count@
564     \edef\bbl@id@last{\the\count@}%
565     \ifcase\bbl@engine\or
566       \directlua{
567         Babel.locale_props[\bbl@id@last] = {}
568         Babel.locale_props[\bbl@id@last].name = '\language'
569         Babel.locale_props[\bbl@id@last].vars = {}
570       }%
571     \fi}%
572   {}}%
573 \chardef\localeid\bbl@c{l{id@}}
```

The unprotected part of \selectlanguage. In case it is used as environment, declare \endselectlanguage, just for safety.

```
574 \expandafter\def\csname selectlanguage \endcsname#1{%

579 \let\endselectlanguage\relax
```

\bbl@set@language The macro \bbl@set@language takes care of switching the language environment *and* of writing entries on the auxiliary files. For historical reasons, language names can be either language of \language. To catch either form a trick is used, but unfortunately as a side effect the catcodes of letters in \language are messed up. This is a bug, but preserved for backwards compatibility. The list of auxiliary files can be extended by redefining \BabelContentsFiles, but make sure they are loaded inside a group (as aux, toc, lof, and lot do) or the last language of the document will remain active afterwards.

We also write a command to change the current language in the auxiliary files.

\bbl@save@lastskip is used to deal with skips before the write whatsit (as suggested by U Fischer). Adapted from hyperref, but it might fail, so I’ll consider it a temporary hack, while I study other options (the ideal, but very likely unfeasible except perhaps in luatex, is to avoid the \write altogether when not needed).

```

```

First, check if the user asks for a known language. If so, update the value of `\language` and call `\originalTeX` to bring \TeX in a certain pre-defined state.

The name of the language is stored in the control sequence `\language`.

Then we have to *redefine* `\originalTeX` to compensate for the things that have been activated. To save memory space for the macro definition of `\originalTeX`, we construct the control sequence name for the `\noextras{language}` command at definition time by expanding the `\cscname` primitive.

Now activate the language-specific definitions. This is done by constructing the names of three macros by concatenating three words with the argument of `\selectlanguage`, and calling these macros.

The switching of the values of `\lefthyphenmin` and `\righthyphenmin` is somewhat different. First we save their current values, then we check if `\(language)hyphenmins` is defined. If it is not, we set default values (2 and 3), otherwise the values in `\(language)hyphenmins` will be used.

No text is supposed to be added with switching captions and date, so we remove any spurious spaces with `\babel@bsphack` and `\babel@esphack`.

\foreignlanguage This command takes two arguments, the first argument is the name of the language to use for typesetting the text specified in the second argument.

Unlike `\selectlanguage` this command doesn't switch *everything*, it only switches the hyphenation rules and the extra definitions for the language specified. It does this within a group and assumes the `\extras{language}` command doesn't make any `\global` changes. The coding is very similar to part of `\selectlanguage`.

`\bbl@beforeforeign` is a trick to fix a bug in bidi texts. `\foreignlanguage` is supposed to be a 'text' command, and therefore it must emit a `\leavevmode`, but it does not, and therefore the indent is placed on the opposite margin. For backward compatibility, however, it is done only if a right-to-left script is requested; otherwise, it is no-op.

`(3.11) \foreignlanguage*` is a temporary, experimental macro for a few lines with a different script direction, while preserving the paragraph format (thank the braces around `\par`, things like `\hangindent` are not reset). Do not use it in production, because its semantics and its syntax may change (and very likely will, or even it could be removed altogether). Currently it enters in `vmode` and then selects the language (which in turn sets the paragraph direction).

(3.11) Also experimental are the hook `foreign` and `foreign*`. With them you can redefine `\BabelText` which by default does nothing. Its behavior is not well defined yet. So, use it in horizontal mode only if you do not want surprises.

In other words, at the beginning of a paragraph `\foreignlanguage` enters into `hmode` with the surrounding `lang`, and with `\foreignlanguage*` with the new `lang`.

849 \def\@provideslanguage#1[#2]{%
850 \wlog{Language: #1 #2}%
851 \expandafter\xdef\csname ver@#1.ldf\endcsname{#2}%
852 \endgroup}
853 \fi

```

\originalTeX The macro `\originalTeX` should be known to \TeX at this moment. As it has to be expandable we `\let` it to `\@empty` instead of `\relax`.

```

854 \ifx\originalTeX\@undefined\let\originalTeX\@empty\fi

```

Because this part of the code can be included in a format, we make sure that the macro which initializes the save mechanism, `\babel@beginsave`, is not considered to be undefined.

```

855 \ifx\babel@beginsave\@undefined\let\babel@beginsave\relax\fi

```

A few macro names are reserved for future releases of `babel`, which will use the concept of ‘locale’:

```

856 \providecommand\setlocale{\bbl@error{not-yet-available}}{}{}{}
857 \let\uselocale\setlocale
858 \let\locale\setlocale
859 \let\selectlocale\setlocale
860 \let\textlocale\setlocale
861 \let\textlanguage\setlocale
862 \let\languagegettext\setlocale

```

4.2. Errors

\@nolanerr

\@nopatterns The babel package will signal an error when a documents tries to select a language that hasn't been defined earlier. When a user selects a language for which no hyphenation patterns were loaded into the format he will be given a warning about that fact. We revert to the patterns for \language=0 in that case. In most formats that will be (US)english, but it might also be empty.

\@noopterr When the package was loaded without options not everything will work as expected. An error message is issued in that case.

When the format knows about \PackageError it must be $\text{\LaTeX 2}_{\epsilon}$, so we can safely use its error handling interface. Otherwise we'll have to 'keep it simple'.

Infos are not written to the console, but on the other hand many people think warnings are errors, so a further message type is defined: an important info which is sent to the console.

```

Here ended the now discarded switch.def.
Here also (currently) ends the base option.

4.3. More on selection

\babelensure The user command just parses the optional argument and creates a new macro named \bbl@e@<language>. We register a hook at the afterextras event which just executes this macro in a “complete” selection (which, if undefined, is \relax and does nothing). This part is somewhat involved because we have to make sure things are expanded the correct number of times.

The macro \bbl@e@<language> contains \bbl@ensure{<include>}{<exclude>}{<fontenc>}, which in turn loops over the macros names in \bbl@captionslist, excluding (with the help of \in@) those in the exclude list. If the fontenc is given (and not \relax), the \fontencoding is also added. Then we loop over the include list, but if the macro already contains \foreignlanguage, nothing is done. Note this macro (1) is not restricted to the preamble, and (2) changes are local.

```

```

4.4. Short tags

\babeltags This macro is straightforward. After zapping spaces, we loop over the list and define the macros `\text⟨tag⟩` and `\⟨tag⟩`. Definitions are first expanded so that they don't contain `\csname` but the actual macro.

```
958 \bbl@trace{Short tags}
959 \newcommand\babeltags[1]{%
960   \edef\bbl@tempa{\zap@space#1 \@empty}%
961   \def\bbl@tempb##1=##2\@{
962     \edef\bbl@tempc{%
963       \noexpand\newcommand
964       \expandafter\noexpand\csname ##1\endcsname{%
965         \noexpand\protect
966         \expandafter\noexpand\csname otherlanguage*\endcsname{##2}}
967       \noexpand\newcommand
968       \expandafter\noexpand\csname text##1\endcsname{%
969         \noexpand\foreignlanguage{##2}}
970     \bbl@tempc}%
971   \bbl@for\bbl@tempa\bbl@tempa{%
972     \expandafter\bbl@tempb\bbl@tempa\@{}}
```

4.5. Compatibility with language.def

Plain e-TeX doesn't rely on language.dat, but babel can be made compatible with this format easily.

```
973 \bbl@trace{Compatibility with language.def}
974 \ifx\directlua\@undefined\else
975   \ifx\bbl@luapatterns\@undefined
976     \input luabelabel.def
977   \fi
978 \fi
979 \ifx\bbl@languages\@undefined
980   \ifx\directlua\@undefined
981     \openin1 = language.def % TODO. Remove hardcoded number
982     \ifeof1
983       \closein1
984       \message{I couldn't find the file language.def}
985     \else
986       \closein1
987       \begingroup
988         \def\addlanguage#1#2#3#4#5{%
989           \expandafter\ifx\csname lang@#1\endcsname\relax\else
990             \global\expandafter\let\csname l@#1\endcsname\expandafter\endcsname
991             \csname lang@#1\endcsname
992           \fi}%
993         \def\uselanguage#1{%
994           \input language.def
995         \endgroup
996       \fi
997     \fi
998   \chardef\l@english\z@
999 \fi
```

\addto It takes two arguments, a *⟨control sequence⟩* and TeX-code to be added to the *⟨control sequence⟩*.

If the *⟨control sequence⟩* has not been defined before it is defined now. The control sequence could also expand to `\relax`, in which case a circular definition results. The net result is a stack overflow. Note there is an inconsistency, because the assignment in the last branch is global.

```
1000 \def\addto#1#2{%
1001   \ifx#1\@undefined
1002     \def#1{#2}%
1003   \else
1004     \ifx#1\relax
```

```

1005     \def#1{#2}%

1008     \xdef#1{\the\toks@}}%
1009     \fi
1010 \fi}

```

4.6. Hooks

Admittedly, the current implementation is a somewhat simplistic and does very little to catch errors, but it is meant for developers, after all. `\bbl@usehooks` is the commands used by babel to execute hooks defined for an event.

```

1011 \bbl@trace{Hooks}
1012 \newcommand\AddBabelHook[3][ ]{%
1013   \bbl@i funset{\bbl@hk@#2}{\EnableBabelHook{#2}}}%
1014   \def\bbl@tempa##1,##3=##2,##3\@empty{\def\bbl@tempb{##2}}%
1015   \expandafter\bbl@tempa\bbl@evargs,##3=,\@empty
1016   \bbl@i funset{\bbl@ev@#2@#3@#1}%
1017   {\bbl@csarg\bbl@add{ev@#3@#1}{\bbl@elth{#2}}}%
1018   {\bbl@csarg\let{ev@#2@#3@#1}\relax}%
1019   \bbl@csarg\newcommand{ev@#2@#3@#1}{\bbl@tempb}}
1020 \newcommand\EnableBabelHook[1]{\bbl@csarg\let{hk@#1}\@firstofone}
1021 \newcommand\DisableBabelHook[1]{\bbl@csarg\let{hk@#1}\@gobble}
1022 \def\bbl@usehooks{\bbl@usehooks@lang\language}
1023 \def\bbl@usehooks@lang#1#2#3{% Test for Plain
1024   \ifx\UseHook\@undefined\else\UseHook{babel/*/#2}\fi
1025   \def\bbl@elth##1{%
1026     \bbl@cs{hk@##1}{\bbl@cs{ev@##1@#2@#3}}%
1027     \bbl@cs{ev@#2@#3}%
1028     \ifx\language\@undefined\else % Test required for Plain (?)
1029       \ifx\UseHook\@undefined\else\UseHook{babel/#1/#2}\fi
1030       \def\bbl@elth##1{%
1031         \bbl@cs{hk@##1}{\bbl@cs{ev@##1@#2@#1#3}}%
1032         \bbl@cs{ev@#2@#1}%
1033       \fi}

```

To ensure forward compatibility, arguments in hooks are set implicitly. So, if a further argument is added in the future, there is no need to change the existing code. Note events intended for `hyphen.cfg` are also loaded (just in case you need them for some reason).

```

1034 \def\bbl@evargs{,% <- don't delete this comma
1035   everylanguage=1,loadkernel=1,loadpatterns=1,loadexceptions=1,%
1036   adddialect=2,patterns=2,defaultcommands=0,encodedcommands=2,write=0,%
1037   beforeextras=0,afterextras=0,stopcommands=0,stringprocess=0,%
1038   hyphenation=2,initiateactive=3,afterreset=0,foreign=0,foreign*=0,%
1039   beforestart=0,language=2,begindocument=1}
1040 \ifx\NewHook\@undefined\else % Test for Plain (?)
1041   \def\bbl@tempa#1=#2\@{ \NewHook{babel/#1}}
1042   \bbl@foreach\bbl@evargs{\bbl@tempa#1\@}
1043 \fi

```

Since the following command is meant for a hook (although a `LaTeXone`), it's placed here:

```

1044 \providecommand\PassOptionsToLocale[2]{%
1045   \@namedef{\bbl@passto@#2}{#1}}

```

4.7. Setting up language files

\LdfInit `\LdfInit` macro takes two arguments. The first argument is the name of the language that will be defined in the language definition file; the second argument is either a control sequence or a string from which a control sequence should be constructed. The existence of the control sequence indicates that the file has been processed before.

At the start of processing a language definition file we always check the category code of the at-sign. We make sure that it is a 'letter' during the processing of the file. We also save its name as the last called option, even if not loaded.

Another character that needs to have the correct category code during processing of language definition files is the equals sign, ‘=’, because it is sometimes used in constructions with the `\let` primitive. Therefore we store its current catcode and restore it later on.

Now we check whether we should perhaps stop the processing of this file. To do this we first need to check whether the second argument that is passed to `\LdfInit` is a control sequence. We do that by looking at the first token after passing #2 through `string`. When it is equal to `\@backslashchar` we are dealing with a control sequence which we can compare with `\@undefined`.

If so, we call `\ldf@quit` to set the main language, restore the category code of the `@`-sign and call `\endinput`

When #2 was *not* a control sequence we construct one and compare it with `\relax`.

Finally we check `\originalTeX`.

```

1046 \bbl@trace{Macros for setting language files up}
1047 \def\bbl@ldfinit{%
1048   \let\bbl@screset\@empty

1085   \bbl@afterldf{#1}%
1086   \expandafter\main@language\expandafter{#1}%
1087   \catcode`\@=\atcatcode \let\atcatcode\relax
1088   \catcode`\==\eqcatcode \let\eqcatcode\relax}

```

After the preamble of the document the commands `\LdfInit`, `\ldf@quit` and `\ldf@finish` are no longer needed. Therefore they are turned into warning messages in `ltx`.

```
1089 \@onlypreamble\LdfInit
1090 \@onlypreamble\ldf@quit
1091 \@onlypreamble\ldf@finish
```

\main@language

\bbl@main@language This command should be used in the various language definition files. It stores its argument in `\bbl@main@language`; to be used to switch to the correct language at the beginning of the document.

```
1092 \def\main@language#1{%
1093   \def\bbl@main@language{#1}%
1094   \let\language\main@language
1095   \let\localename\bbl@main@language
1096   \let\mainlocalename\bbl@main@language
1097   \bbl@id@assign
1098   \bbl@patterns{\language}}
```

We also have to make sure that some code gets executed at the beginning of the document, either when the aux file is read or, if it does not exist, when the `\AtBeginDocument` is executed. Languages do not set `\pagedir`, so we set here for the whole document to the main `\bodydir`.

The code written to the aux file attempts to avoid errors if babel is removed from the document.

```
1099 \def\bbl@beforestart{%
1100   \def\@nolanerr##1{%
1101     \bbl@carg\chardef{l@##1}\z@

1127     \select@language{#1}%
1128   \fi}
```

4.8. Shorthands

The macro `\initiate@active@char` below takes all the necessary actions to make its argument a shorthand character. The real work is performed once for each character. But first we define a little tool.

```
1129 \bbl@trace{Shorthands}
1130 \def\bbl@withactive#1#2{%
```

```

1131 \begingroup
1132 \lccode`~=`#2\relax
1133 \lowercase{\endgroup#1~}}

```

\bbl@add@special The macro `\bbl@add@special` is used to add a new character (or single character control sequence) to the macro `\dospecials` (and `\@sanitize` if \TeX is used). It is used only at one place, namely when `\initiate@active@char` is called (which is ignored if the char has been made active before). Because `\@sanitize` can be undefined, we put the definition inside a conditional.

Items are added to the lists without checking its existence or the original catcode. It does not hurt, but should be fixed. It's already done with `\nfss@catcodes`, added in 3.10.

```

1134 \def\bbl@add@special#1{% 1:a macro like \", \?, etc.
1135 \bbl@add\dospecials{\do#1}% test @sanitize = \relax, for back. compat.
1136 \bbl@ifunset{@sanitize}{\bbl@add@sanitize{\@makeother#1}}%
1137 \ifx\nfss@catcodes\undefined\else % TODO - same for above
1138 \begingroup
1139 \catcode`#1\active
1140 \nfss@catcodes
1141 \ifnum\catcode`#1=\active
1142 \endgroup
1143 \bbl@add\nfss@catcodes{\@makeother#1}%
1144 \else
1145 \endgroup
1146 \fi
1147 \fi}

```

\initiate@active@char A language definition file can call this macro to make a character active. This macro takes one argument, the character that is to be made active. When the character was already active this macro does nothing. Otherwise, this macro defines the control sequence `\normal@char<char>` to expand to the character in its ‘normal state’ and it defines the active character to expand to `\normal@char<char>` by default (`<char>` being the character to be made active). Later its definition can be changed to expand to `\active@char<char>` by calling `\bbl@activate{<char>}`.

For example, to make the double quote character active one could have `\initiate@active@char{"}` in a language definition file. This defines `"` as `\active@prefix "\active@char"` (where the first `"` is the character with its original catcode, when the shorthand is created, and `\active@char` is a single token). In protected contexts, it expands to `\protect "` or `\noexpand "` (ie, with the original `"`); otherwise `\active@char` is executed. This macro in turn expands to `\normal@char` in “safe” contexts (eg, `\label`), but `\user@active` in normal “unsafe” ones. The latter search a definition in the user, language and system levels, in this order; but if none is found, `\normal@char` is used. However, a deactivated shorthand (with `\bbl@deactivate` is defined as `\active@prefix "\normal@char`).

The following macro is used to define shorthands in the three levels. It takes 4 arguments: the (string’ed) character, `\<level>@group`, `\<level>@active` and `\<next-level>@active` (except in system).

```

1148 \def\bbl@active@def#1#2#3#4{%
1149 \namedef{#3#1}{%
1150 \expandafter\ifx\csname#2@sh@#1\endcsname\relax
1151 \bbl@afterelse\bbl@sh@select#2#1{#3@arg#1}{#4#1}%
1152 \else
1153 \bbl@afterfi\csname#2@sh@#1\endcsname
1154 \fi}%

```

When there is also no current-level shorthand with an argument we will check whether there is a next-level defined shorthand for this active character.

```

1155 \long\namedef{#3@arg#1}##1{%
1156 \expandafter\ifx\csname#2@sh@#1\string##1\endcsname\relax
1157 \bbl@afterelse\csname#4#1\endcsname##1%
1158 \else
1159 \bbl@afterfi\csname#2@sh@#1\string##1\endcsname
1160 \fi}}%

```

`\initiate@active@char` calls `\@initiate@active@char` with 3 arguments. All of them are the same character with different catcodes: active, other (`\string’ed`) and the original one. This trick simplifies the code a lot.

```

1161 \def\initiate@active@char#1{%
1162   \bbl@ifunset{active@char\string#1}%
1163   {\bbl@withactive
1164     {\expandafter\@initiate@active@char\expandafter}#1\string#1}%
1165   {}}

```

The very first thing to do is saving the original catcode and the original definition, even if not active, which is possible (undefined characters require a special treatment to avoid making them \relax and preserving some degree of protection).

```

1166 \def\@initiate@active@char#1#2#3{%
1167   \bbl@csarg\edef{oricat@#2}{\catcode`#2=\the\catcode`#2\relax}%
1168   \ifx#1\@undefined
1169     \bbl@csarg\def{oridef@#2}{\def#1{\active@prefix#1\@undefined}}%
1170   \else
1171     \bbl@csarg\let{oridef@#2}#1%
1172     \bbl@csarg\edef{oridef@#2}{%
1173       \let\noexpand#1%
1174       \expandafter\noexpand\csname bbl@oridef@#2\endcsname}%
1175   \fi

```

If the character is already active we provide the default expansion under this shorthand mechanism. Otherwise we write a message in the transcript file, and define \normal@char⟨char⟩ to expand to the character in its default state. If the character is mathematically active when babel is loaded (for example ') the normal expansion is somewhat different to avoid an infinite loop (but it does not prevent the loop if the mathcode is set to "8000 *a posteriori*).

```

1176   \ifx#1#3\relax
1177     \expandafter\let\csname normal@char#2\endcsname#3%
1178   \else
1179     \bbl@info{Making #2 an active character}%
1180     \ifnum\mathcode`#2=\ifodd\bbl@engine"1000000 \else"8000 \fi
1181     \@namedef{normal@char#2}{%
1182       \textormath{#3}{\csname bbl@oridef@#2\endcsname}}%
1183     \else
1184       \@namedef{normal@char#2}{#3}%
1185     \fi

```

To prevent problems with the loading of other packages after babel we reset the catcode of the character to the original one at the end of the package and of each language file (except with KeepShorthandsActive). It is re-activate again at \begin{document}. We also need to make sure that the shorthands are active during the processing of the .aux file. Otherwise some citations may give unexpected results in the printout when a shorthand was used in the optional argument of \bibitem for example. Then we make it active (not strictly necessary, but done for backward compatibility).

```

1186   \bbl@restoreactive{#2}%
1187   \AtBeginDocument{%
1188     \catcode`#2\active
1189     \if@filesw
1190       \immediate\write\@mainaux{\catcode`\string#2\active}%
1191     \fi}%
1192   \expandafter\bbl@add@special\csname#2\endcsname
1193   \catcode`#2\active
1194   \fi

```

Now we have set \normal@char⟨char⟩, we must define \active@char⟨char⟩, to be executed when the character is activated. We define the first level expansion of \active@char⟨char⟩ to check the status of the @safe@actives flag. If it is set to true we expand to the 'normal' version of this character, otherwise we call \user@active⟨char⟩ to start the search of a definition in the user, language and system levels (or eventually normal@char⟨char⟩).

```

1195   \let\bbl@tempa\@firstoftwo
1196   \if\string^#2%
1197     \def\bbl@tempa{\noexpand\textormath}%

1201     \fi

```

```

1202 \fi
1203 \expandafter\edef\csname active@char#2\endcsname{%
1204   \bbl@tempa
1205   {\noexpand\if@safe@actives
1206    \noexpand\expandafter
1207    \expandafter\noexpand\csname normal@char#2\endcsname
1208    \noexpand\else
1209    \noexpand\expandafter
1210    \expandafter\noexpand\csname bbl@doactive#2\endcsname
1211    \noexpand\fi}%
1212   {\expandafter\noexpand\csname normal@char#2\endcsname}}%
1213 \bbl@csarg\edef{doactive#2}{%
1214   \expandafter\noexpand\csname user@active#2\endcsname}%

```

We now define the default values which the shorthand is set to when activated or deactivated. It is set to the deactivated form (globally), so that the character expands to

$$\backslash active@prefix \langle char \rangle \backslash normal@char \langle char \rangle$$

(where $\backslash active@char \langle char \rangle$ is *one* control sequence!).

```

1215 \bbl@csarg\edef{active@#2}{%
1216   \noexpand\active@prefix\noexpand#1%
1217   \expandafter\noexpand\csname active@char#2\endcsname}%
1218 \bbl@csarg\edef{normal@#2}{%
1219   \noexpand\active@prefix\noexpand#1%
1220   \expandafter\noexpand\csname normal@char#2\endcsname}%
1221 \bbl@ncarg\let#1\bbl@normal@#2}%

```

The next level of the code checks whether a user has defined a shorthand for himself with this character. First we check for a single character shorthand. If that doesn't exist we check for a shorthand with an argument.

```

1222 \bbl@active@def#2\user@group{user@active}{language@active}%
1223 \bbl@active@def#2\language@group{language@active}{system@active}%
1224 \bbl@active@def#2\system@group{system@active}{normal@char}%

```

In order to do the right thing when a shorthand with an argument is used by itself at the end of the line we provide a definition for the case of an empty argument. For that case we let the shorthand character expand to its non-active self. Also, When a shorthand combination such as ' ' ends up in a heading T_EX would see $\backslash protect '\backslash protect '$. To prevent this from happening a couple of shorthand needs to be defined at user level.

```

1225 \expandafter\edef\csname\user@group @sh#2@@\endcsname
1226   {\expandafter\noexpand\csname normal@char#2\endcsname}%
1227 \expandafter\edef\csname\user@group @sh#2@\string\protect@\endcsname
1228   {\expandafter\noexpand\csname user@active#2\endcsname}%

```

Finally, a couple of special cases are taken care of. (1) If we are making the right quote (') active we need to change $\backslash prim@s$ as well. Also, make sure that a single ' in math mode 'does the right thing'. (2) If we are using the caret (^) as a shorthand character special care should be taken to make sure math still works. Therefore an extra level of expansion is introduced with a check for math mode on the upper level.

```

1229 \if\string'#2%
1230   \let\prim@s\bbl@prim@s
1231   \let\active@math@prime#1%
1232 \fi
1233 \bbl@usehooks{initiateactive}{\#1}{\#2}{\#3}}

```

The following package options control the behavior of shorthands in math mode.

```

1234 << *More package options >> ≡
1235 \DeclareOption{math=active}{}
1236 \DeclareOption{math=normal}{\def\bbl@mathnormal{\noexpand\textormath}}
1237 << /More package options >>

```

Initiating a shorthand makes active the char. That is not strictly necessary but it is still done for backward compatibility. So we need to restore the original catcode at the end of package *and* the end of the *ldf*.

```

1238 \ifpackagewith{babel}{KeepShorthandsActive}%
1239 {\let\bbl@restoreactive\@gobble}%
1240 {\def\bbl@restoreactive#1{%
1241   \bbl@exp{%
1242     \\AfterBabelLanguage\\CurrentOption
1243     {\catcode`#1=\the\catcode`#1\relax}%
1244     \\AtEndOfPackage
1245     {\catcode`#1=\the\catcode`#1\relax}}}%
1246   \AtEndOfPackage{\let\bbl@restoreactive\@gobble}}

```

\bbl@sh@select This command helps the shorthand supporting macros to select how to proceed. Note that this macro needs to be expandable as do all the shorthand macros in order for them to work in expansion-only environments such as the argument of \hyphenation.

This macro expects the name of a group of shorthands in its first argument and a shorthand character in its second argument. It will expand to either \bbl@firstcs or \bbl@scndcs. Hence two more arguments need to follow it.

```

1247 \def\bbl@sh@select#1#2{%
1248   \expandafter\ifx\csname#1@sh@#2@sel\endcsname\relax
1249     \bbl@afterelse\bbl@scndcs
1250   \else
1251     \bbl@afterfi\csname#1@sh@#2@sel\endcsname
1252   \fi}

```

\active@prefix Used in the expansion of active characters has a function similar to \OT1-cmd in that it \protects the active character whenever \protect is *not* \typeset@protect. The \@gobble is needed to remove a token such as \activechar: (when the double colon was the active character to be dealt with). There are two definitions, depending of \ifincsname is available. If there is, the expansion will be more robust.

```

1253 \begingroup
1254 \bbl@ifunset{ifincsname}%^^A Ugly. Correct? Only Plain?

1279   \fi}}
1280 \endgroup

```

if@safe@actives In some circumstances it is necessary to be able to reset the shorthand to its ‘normal’ value (usually the character with catcode ‘other’) on the fly. For this purpose the switch @safe@actives is available. The setting of this switch should be checked in the first level expansion of \active@char⟨char⟩. When this expansion mode is active (with \@safe@activetrue), something like “₁₃”₁₃ becomes “₁₂”₁₂ in an \edef (in other words, shorthands are \string’ed). This contrasts

with `\protected@edef`, where catcodes are always left unchanged. Once converted, they can be used safely even after this expansion mode is deactivated (with `\@safe@activefalse`).

```
1281 \newif\if@safe@actives
1282 \@safe@activesfalse
```

\bbl@restore@actives When the output routine kicks in while the active characters were made “safe” this must be undone in the headers to prevent unexpected typeset results. For this situation we define a command to make them “unsafe” again.

```
1283 \def\bbl@restore@actives{\if@safe@actives\@safe@activesfalse\fi}
```

\bbl@activate

\bbl@deactivate Both macros take one argument, like `\initiate@active@char`. The macro is used to change the definition of an active character to expand to `\active@char⟨char⟩` in the case of `\bbl@activate`, or `\normal@char⟨char⟩` in the case of `\bbl@deactivate`.

```
1284 \chardef\bbl@activated\z@
1285 \def\bbl@activate#1{%
1286   \chardef\bbl@activated\@ne
1287   \bbl@withactive{\expandafter\let\expandafter}#1%
1288   \csname bbl@active@\string#1\endcsname}
1289 \def\bbl@deactivate#1{%
1290   \chardef\bbl@activated\tw@
1291   \bbl@withactive{\expandafter\let\expandafter}#1%
1292   \csname bbl@normal@\string#1\endcsname}
```

\bbl@firstcs

\bbl@scndcs These macros are used only as a trick when declaring shorthands.

```
1293 \def\bbl@firstcs#1#2{\csname#1\endcsname}
1294 \def\bbl@scndcs#1#2{\csname#2\endcsname}
```

\declare@shorthand Used to declare a shorthand on a certain level. It takes three arguments:

1. a name for the collection of shorthands, i.e. ‘system’, or ‘dutch’;
2. the character (sequence) that makes up the shorthand, i.e. `~` or `"a`;
3. the code to be executed when the shorthand is encountered.

The auxiliary macro `\babel@texpdf` improves the interoperativity with `hyperref` and takes 4 arguments: (1) The \TeX code in text mode, (2) the string for `hyperref`, (3) the \TeX code in math mode, and (4), which is currently ignored, but it’s meant for a string in math mode, like a minus sign instead of an hyphen (currently `hyperref` doesn’t discriminate the mode). This macro may be used in `ldf` files.

```
1295 \def\babel@texpdf#1#2#3#4{%
1296   \ifx\texorpdfstring\undefined
1297     \textormath{#1}{#3}%
1298   \else

1328 \fi}

```

\textormath Some of the shorthands that will be declared by the language definition files have to be usable in both text and mathmode. To achieve this the helper macro `\textormath` is provided.

```

1329 \def\textormath{%
1330 \ifmmode
1331 \expandafter\@secondoftwo
1332 \else
1333 \expandafter\@firstoftwo
1334 \fi}

```

\user@group

\language@group

\system@group The current concept of ‘shorthands’ supports three levels or groups of shorthands. For each level the name of the level or group is stored in a macro. The default is to have a user group; use language group ‘english’ and have a system group called ‘system’.

```

1335 \def\user@group{user}
1336 \def\language@group{english} %^^A I don't like defaults
1337 \def\system@group{system}

```

\usesshorthands This is the user level macro. It initializes and activates the character for use as a shorthand character (ie, it’s active in the preamble). Languages can deactivate shorthands, so a starred version is also provided which activates them always after the language has been switched.

```

1338 \def\usesshorthands{%
1339 \@ifstar\bbl@usesesh@s{\bbl@usesesh@x{}}
1340 \def\bbl@usesesh@s#1{%
1341 \bbl@usesesh@x

1347 \initiate@active@char{#2}%
1348 #1%
1349 \bbl@activate{#2}}%
1350 {\bbl@error{shorthand-is-off}{#2}{}}}

```

\defineshorthand Currently we only support two groups of user level shorthands, named internally `user` and `user@(\language)` (language-dependent user shorthands). By default, only the first one is taken into account, but if the former is also used (in the optional argument of `\defineshorthand`) a new level is inserted for it (`user@generic`, done by `\bbl@set@user@generic`); we make also sure `{}` and `\protect` are taken into account in this new top level.

```

1351 \def\user@language@group{user@\language@group}
1352 \def\bbl@set@user@generic#1#2{%
1353 \bbl@ifunset{user@generic@active#1}%

```

Usually the `~` is active and expands to `\penalty\@M__`. When it is written to the `.aux` file it is written expanded. To prevent that and to be able to use the character `~` as a start character for a shorthand, it is redefined here as a one character shorthand on system level. The system declaration is in most cases redundant (when `~` is still a non-break space), and in some cases is inconvenient (if `~` has been redefined); however, for backward compatibility it is maintained (some existing documents may rely on the `babel` value).

```

1462 \initiate@active@char{~}
1463 \declare@shorthand{system}{~}{\leavevmode\nobreak\ }
1464 \bbl@activate{~}

```

\OT1dqpos

\T1dqpos The position of the double quote character is different for the OT1 and T1 encodings. It will later be selected using the `\f@encoding` macro. Therefore we define two macros here to store the position of the character in these encodings.

```

1465 \expandafter\def\csname OT1dqpos\endcsname{127}
1466 \expandafter\def\csname T1dqpos\endcsname{4}

```

When the macro `\f@encoding` is undefined (as it is in plain \TeX) we define it here to expand to OT1

```

1467 \ifx\f@encoding\undefined
1468 \def\f@encoding{OT1}
1469 \fi

```

4.9. Language attributes

Language attributes provide a means to give the user control over which features of the language definition files he wants to enable.

\languageattribute The macro `\languageattribute` checks whether its arguments are valid and then activates the selected language attribute. First check whether the language is known, and then process each attribute in the list.

```

1470 \bbl@trace{Language attributes}
1471 \newcommand\languageattribute[2]{%
1472 \def\bbl@tempc{#1}%

1529 \def\bbl@clear@ttrib#1-#2.{%
1530 \expandafter\let\csname#1@attr@#2\endcsname\undefined}
1531 \AtBeginDocument{\bbl@clear@ttribs}

```

4.10. Support for saving and redefining macros

To save the meaning of control sequences using `\babel@save`, we use temporary control sequences. To save hash table entries for these control sequences, we don't use the name of the control sequence to be saved to construct the temporary name. Instead we simply use the value of a counter, which is reset to zero each time we begin to save new values. This works well because we release the saved meanings before we begin to save a new set of control sequence meanings (see `\selectlanguage` and `\originalTeX`). Note undefined macros are not undefined any more when saved – they are `\relax`'ed.

\babel@savecnt

\babel@beginsave The initialization of a new save cycle: reset the counter to zero.

```

1532 \bbl@trace{Macros for saving definitions}
1533 \def\babel@beginsave{\babel@savecnt\z@}

```

Before it's forgotten, allocate the counter and initialize all.

```

1534 \newcount\babel@savecnt
1535 \babel@beginsave

```

\babel@save

\babel@savevariable The macro `\babel@save{csname}` saves the current meaning of the control sequence `<csname>` to `\originalTeX` (which has to be expandable, i. e. you shouldn't let it to `\relax`). To do this, we let the current meaning to a temporary control sequence, the restore commands are appended to `\originalTeX` and the counter is incremented. The macro `\babel@savevariable{variable}` saves the value of the variable. `<variable>` can be anything allowed after the `\the` primitive. To avoid messing saved definitions up, they are saved only the very first time.

```

1536 \def\babel@save#1{%
1537 \def\bbl@tempa{{, #1,}}% Clumsy, for Plain
1538 \expandafter\bbl@add\expandafter\bbl@tempa\expandafter{%
1539 \expandafter{\expandafter, \bbl@savextras,}}%
1540 \expandafter\in@\bbl@tempa
1541 \ifin@\else
1542 \bbl@add\bbl@savextras{, #1,}%
1543 \bbl@carg\let\babel@number\babel@savecnt\#1\relax
1544 \toks@{\expandafter{\originalTeX\let#1=}}%
1545 \bbl@exp{%
1546 \def\\originalTeX{\the\toks@<\babel@number\babel@savecnt>\relax}}%
1547 \advance\babel@savecnt@ne
1548 \fi}
1549 \def\babel@savevariable#1{%
1550 \toks@{\expandafter{\originalTeX #1=}}%
1551 \bbl@exp{\def\\originalTeX{\the\toks@the#1\relax}}}

```

\bbl@redefine To redefine a command, we save the old meaning of the macro. Then we redefine it to call the original macro with the ‘sanitized’ argument. The reason why we do it this way is that we don’t want to redefine the \TeX macros completely in case their definitions change (they have changed in the past). A macro named `\macro` will be saved new control sequences named `\org@macro`.

```
1552 \def\bbl@redefine#1{%
1553   \edef\bbl@tempa{\bbl@stripslash#1}%
1554   \expandafter\let\csname org@\bbl@tempa\endcsname#1%
1555   \expandafter\def\csname\bbl@tempa\endcsname}
1556 \@onlypreamble\bbl@redefine
```

\bbl@redefine@long This version of `\babel@redefine` can be used to redefine `\long` commands such as `\ifthenelse`.

```
1557 \def\bbl@redefine@long#1{%
1558   \edef\bbl@tempa{\bbl@stripslash#1}%
1559   \expandafter\let\csname org@\bbl@tempa\endcsname#1%
1560   \long\expandafter\def\csname\bbl@tempa\endcsname}
1561 \@onlypreamble\bbl@redefine@long
```

\bbl@redefineroobust For commands that are redefined, but which *might* be robust we need a slightly more intelligent macro. A robust command `foo` is defined to expand to `\protect\foo`. So it is necessary to check whether `\foo` exists. The result is that the command that is being redefined is always robust afterwards. Therefore all we need to do now is define `\foo`.

```
1562 \def\bbl@redefineroobust#1{%
1563   \edef\bbl@tempa{\bbl@stripslash#1}%
1564   \bbl@ifunset{\bbl@tempa\space}%
1565     {\expandafter\let\csname org@\bbl@tempa\endcsname#1%
1566      \bbl@exp{\def\#1{\protect\<\bbl@tempa\space>}}}%
1567     {\bbl@exp{\let\<org@\bbl@tempa>\<\bbl@tempa\space>}}}%
1568     \@namedef{\bbl@tempa\space}}
1569 \@onlypreamble\bbl@redefineroobust
```

4.11. French spacing

\bbl@frenchspacing

\bbl@nonfrenchspacing Some languages need to have `\frenchspacing` in effect. Others don’t want that. The command `\bbl@frenchspacing` switches it on when it isn’t already in effect and `\bbl@nonfrenchspacing` switches it off if necessary.

```
1570 \def\bbl@frenchspacing{%
1571   \ifnum\the\sfcodes\.\=\@m
1572     \let\bbl@nonfrenchspacing\relax
1573   \else
1574     \frenchspacing
1575     \let\bbl@nonfrenchspacing\nonfrenchspacing
1576   \fi}
1577 \let\bbl@nonfrenchspacing\nonfrenchspacing
```

A more refined way to switch the catcodes is done with `ini` files. Here an auxiliary macro is defined, but the main part is in `\babelprovide`. This new method should be ideally the default one.

```
1578 \let\bbl@elt\relax
1579 \edef\bbl@fs@chars{%
1580   \bbl@elt{\string.}\@m{3000}\bbl@elt{\string?}\@m{3000}%
1581   \bbl@elt{\string!}\@m{3000}\bbl@elt{\string:}\@m{2000}%
1582   \bbl@elt{\string;}\@m{1500}\bbl@elt{\string,}\@m{1250}}
1583 \def\bbl@pre@fs{%
1584   \def\bbl@elt##1##2##3{\sfcodes`##1=\the\sfcodes`##1\relax}%
1585   \edef\bbl@save@sfcodes{\bbl@fs@chars}%
1586   \def\bbl@post@fs{%
1587     \bbl@save@sfcodes

1589     \edef\bbl@tempa{\expandafter\@car\bbl@tempa\@nil}%
```

```

1590 \if u\bbl@tempa      % do nothing
1591 \else\if n\bbl@tempa  % non french
1592   \def\bbl@elt##1##2##3{%
1593     \ifnum\sfcode`##1=##2\relax
1594       \babel@savevariable{\sfcode`##1}%
1595       \sfcode`##1=##3\relax
1596     \fi}%
1597   \bbl@fs@chars
1598 \else\if y\bbl@tempa   % french
1599   \def\bbl@elt##1##2##3{%
1600     \ifnum\sfcode`##1=##3\relax
1601       \babel@savevariable{\sfcode`##1}%
1602       \sfcode`##1=##2\relax
1603     \fi}%
1604   \bbl@fs@chars
1605 \fi\fi\fi}

```

4.12. Hyphens

\babelhyphenation This macro saves hyphenation exceptions. Two macros are used to store them: `\bbl@hyphenation@` for the global ones and `\bbl@hyphenation@⟨language⟩` for language ones. See `\bbl@patterns` above for further details. We make sure there is a space between words when multiple commands are used.

```

1606 \bbl@trace{Hyphens}
1607 \@onlypreamble\babelhyphenation
1608 \AtEndOfPackage{%
1609   \newcommand\babelhyphenation[2][\@empty]{%
1610     \ifx\bbl@hyphenation@\relax
1611       \let\bbl@hyphenation@\@empty
1612     \fi
1613     \ifx\bbl@hyphlist\@empty\else
1614       \bbl@warning{%
1615         You must not intermingle \string\selectlanguage\space and\\%
1616         \string\babelhyphenation\space or some exceptions will not\\%
1617         be taken into account. Reported}%
1618       \fi
1619       \ifx\@empty#1%
1620         \protected@edef\bbl@hyphenation@{\bbl@hyphenation@\space#2}%
1621       \else
1622         \bbl@vforeach{#1}{%
1623           \def\bbl@tempa{##1}%
1624           \bbl@fixname\bbl@tempa
1625           \bbl@iflanguage\bbl@tempa{%
1626             \bbl@csarg\protected@edef{hyphenation@\bbl@tempa}{%
1627               \bbl@ifunset{bbl@hyphenation@\bbl@tempa}%
1628               {}%
1629               {\csname bbl@hyphenation@\bbl@tempa\endcsname\space}%
1630               #2}}}%
1631         \fi}}

```

\babelhyphenmins Only \LaTeX (basically because it's defined with a \LaTeX tool).

```

1632 \ifx\NewDocumentCommand\@undefined\else
1633   \NewDocumentCommand\babelhyphenmins{sommo}{%
1634     \IfNoValueTF{#2}%
1635       {\protected@edef\bbl@hyphenmins@{\set@hyphenmins{#3}{#4}}}%
1636       \IfValueT{#5}{%
1637         \protected@edef\bbl@hyphenatmin@{\hyphenationmin=#5\relax}}%
1638       \IfBooleanT{#1}{%
1639         \lefthyphenmin=#3\relax
1640         \righthyphenmin=#4\relax
1641         \IfValueT{#5}{\hyphenationmin=#5\relax}}}%
1642     {\edef\bbl@tempb{\zap@space#2 \@empty}%

```

```

1643 \bbl@for\bbl@tempa\bbl@tempb{%
1644 \namedef\bbl@hyphenmins@bbl@tempa{\set@hyphenmins{#3}{#4}}%
1645 \IfValueT{#5}{%
1646 \namedef\bbl@hyphenatmin@bbl@tempa{\hyphenationmin=#5\relax}}%
1647 \IfBooleanT{#1}{\bbl@error{hyphenmins-args}{}}{}}
1648 \fi

```

\bbl@allowhyphens This macro makes hyphenation possible. Basically its definition is nothing more than `\nobreak \hskip 0pt plus 0pt`. \TeX begins and ends a word for hyphenation at a glue node. The penalty prevents a linebreak at this glue node.

```

1649 \def\bbl@allowhyphens{\ifvmode\else\nobreak\hskip\z@skip\fi}
1650 \def\bbl@t@one{T1}
1651 \def\allowhyphens{\ifx\cf@encoding\bbl@t@one\else\bbl@allowhyphens\fi}

```

\babelhyphen Macros to insert common hyphens. Note the space before @ in `\babelhyphen`. Instead of protecting it with `\DeclareRobustCommand`, which could insert a `\relax`, we use the same procedure as shorthands, with `\active@prefix`.

```

1652 \newcommand\babelnullhyphen{\char\hyphenchar\font}
1653 \def\babelhyphen{\active@prefix\babelhyphen\bbl@hyphen}
1654 \def\bbl@hyphen{%
1655 \ifstar{\bbl@hyphen@i @}{\bbl@hyphen@i \@empty}
1656 \def\bbl@hyphen@i#1#2{%
1657 \bbl@iifunset\bbl@hy@#1#2\@empty}%
1658 {\csname bbl@lusehyphen\endcsname{\discretionary{#2}{}{#2}}}%
1659 {\csname bbl@hy@#1#2\@empty\endcsname}}

```

The following two commands are used to wrap the “hyphen” and set the behavior of the rest of the word – the version with a single @ is used when further hyphenation is allowed, while that with @@ if no more hyphens are allowed. In both cases, if the hyphen is preceded by a positive space, breaking after the hyphen is disallowed.

There should not be a discretionary after a hyphen at the beginning of a word, so it is prevented if preceded by a skip. Unfortunately, this does handle cases like “(-suffix)”. `\nobreak` is always preceded by `\leavevmode`, in case the shorthand starts a paragraph.

```

1660 \def\bbl@usehyphen#1{%
1661 \leavevmode
1662 \ifdim\lastskip>\z@\mbox{#1}\else\nobreak#1\fi
1663 \nobreak\hskip\z@skip}
1664 \def\bbl@@usehyphen#1{%
1665 \leavevmode\ifdim\lastskip>\z@\mbox{#1}\else#1\fi}

```

The following macro inserts the hyphen char.

```

1666 \def\bbl@hyphenchar{%
1667 \ifnum\hyphenchar\font=\m@ne
1668 \babelnullhyphen
1669 \else
1670 \char\hyphenchar\font
1671 \fi}

```

Finally, we define the hyphen “types”. Their names will not change, so you may use them in `\ldf`’s. After a space, the `\mbox` in `\bbl@hy@nobreak` is redundant.

```

1672 \def\bbl@hy@soft{\bbl@usehyphen{\discretionary{\bbl@hyphenchar}{}}{}}
1673 \def\bbl@hy@@soft{\bbl@@usehyphen{\discretionary{\bbl@hyphenchar}{}}{}}
1674 \def\bbl@hy@hard{\bbl@usehyphen\bbl@hyphenchar}
1675 \def\bbl@hy@@hard{\bbl@@usehyphen\bbl@hyphenchar}
1676 \def\bbl@hy@nobreak{\bbl@usehyphen{\mbox{\bbl@hyphenchar}}}
1677 \def\bbl@hy@@nobreak{\mbox{\bbl@hyphenchar}}
1678 \def\bbl@hy@repeat{%
1679 \bbl@usehyphen{%
1680 \discretionary{\bbl@hyphenchar}{\bbl@hyphenchar}{\bbl@hyphenchar}}}
1681 \def\bbl@hy@@repeat{%
1682 \bbl@@usehyphen{%
1683 \discretionary{\bbl@hyphenchar}{\bbl@hyphenchar}{\bbl@hyphenchar}}}

```

```

1684 \def\bbl@hy@empty{\hskip\z@skip}
1685 \def\bbl@hy@@empty{\discretionary{}{}{}}

```

\bbl@disc For some languages the macro \bbl@disc is used to ease the insertion of discretionary for letters that behave ‘abnormally’ at a breakpoint.

```

1686 \def\bbl@disc#1#2{\nobreak\discretionary{#2-}{}{#1}\bbl@allowhyphens}

```

4.13. Multiencoding strings

The aim following commands is to provide a common interface for strings in several encodings. They also contains several hooks which can be used by luatex and xetex. The code is organized here with pseudo-guards, so we start with the basic commands.

Tools But first, a tool. It makes global a local variable. This is not the best solution, but it works.

```

1687 \bbl@trace{Multiencoding strings}
1688 \def\bbl@tglobal#1{\global\let#1#1}

```

The following option is currently no-op. It was meant for the deprecated \SetCase.

```

1689 << *More package options >> ≡
1690 \DeclareOption{nocase}{}
1691 << /More package options >>

```

The following package options control the behavior of \SetString.

```

1692 << *More package options >> ≡
1693 \let\bbl@opt@strings\@nnil % accept strings=value
1694 \DeclareOption{strings}{\def\bbl@opt@strings{\BabelStringsDefault}}
1695 \DeclareOption{strings=encoded}{\let\bbl@opt@strings\relax}
1696 \def\BabelStringsDefault{generic}
1697 << /More package options >>

```

Main command This is the main command. With the first use it is redefined to omit the basic setup in subsequent blocks. We make sure strings contain actual letters in the range 128-255, not active characters.

```

Parse the encoding info to get the label, input, and font parts.

Select the behavior of \SetString. There are two main cases, depending of if there is an optional argument: without it and strings=encoded, strings are defined always; otherwise, they are set only if they are still undefined (ie, fallback values). With labelled blocks and strings=encoded, define the strings, but with another value, define strings only if the current label or font encoding is the value of strings; otherwise (ie, no strings or a block whose label is not in strings=) do nothing.

We presume the current block is not loaded, and therefore set (above) a couple of default values to gobble the arguments. Then, these macros are redefined if necessary according to several parameters.

```

1794 \fi}

```

There are two versions of `\bbbl@scswitch`. The first version is used when `ldfs` are read, and it makes sure `\langle group \rangle \langle language \rangle` is reset, but only once (`\bbbl@screset` is used to keep track of this). The second version is used in the preamble and packages loaded after `babel` and does nothing.

The macro `\bbbl@forlang` loops `\bbbl@L` but its body is executed only if the value is in `\BabelLanguages` (inside `babel`) or `\date \langle language \rangle` is defined (after `babel` has been loaded). There are also two version of `\bbbl@forlang`. The first one skips the current iteration if the language is not in `\BabelLanguages` (used in `ldfs`), and the second one skips undefined languages (after `babel` has been loaded).

```

1795 \def\bbbl@forlang#1#2{%
1796 \bbbl@for#1\bbbl@L{%
1797 \bbbl@xin@{, #1, }{, \BabelLanguages, }%
1798 \ifin@#2\relax\fi}}
1799 \def\bbbl@scswitch{%
1800 \bbbl@forlang\bbbl@tempa{%

1817 \endgroup
1818 \endgroup
1819 \bbbl@scafter}
1820 \let\bbbl@endcommands\EndBabelCommands

```

Now we define commands to be used inside `\StartBabelCommands`.

Strings The following macro is the actual definition of `\SetString` when it is “active”

First save the “switcher”. Create it if undefined. Strings are defined only if undefined (ie, like `\providescommand`). With the event `stringprocess` you can preprocess the string by manipulating the value of `\BabelString`. If there are several hooks assigned to this event, preprocessing is done in the same order as defined. Finally, the string is set.

```

1821 \def\bbbl@setstring#1#2{% eg, \prefacename{<string>}
1822 \bbbl@forlang\bbbl@tempa{%
1823 \edef\bbbl@LC{\bbbl@tempa\bbbl@stripslash#1}%
1824 \bbbl@ifunset{\bbbl@LC}% eg, \germanchaptername

```

```

1825     {\bbl@exp{%
1826       \global\bbbl@add\<\bbl@G\bbl@tempa>{\bbbl@scset\#1\<\bbl@LC>}}}%
1827     }%
1828     \def\BabelString{#2}%
1829     \bbl@usehooks{stringprocess}{}%
1830     \expandafter\bbl@stringdef
1831     \csname\bbl@LC\expandafter\endcsname\expandafter{\BabelString}}

```

A little auxiliary command sets the string. Formerly used with casing. Very likely no longer necessary, although it's used in `\setlocalecaption`.

```

1832 \def\bbl@scset#1#2{\def#1{#2}}

```

Define `\SetStringLoop`, which is actually set inside `\StartBabelCommands`. The current definition is somewhat complicated because we need a count, but `\count@` is not under our control (remember `\SetString` may call hooks). Instead of defining a dedicated count, we just “pre-expand” its value.

```

1833 <<*Macros local to BabelCommands>> ≡
1834 \def\SetStringLoop##1##2{%
1835   \def\bbl@templ####1{\expandafter\noexpand\csname##1\endcsname}%
1836   \count@\z@
1837   \bbl@loop\bbl@tempa{##2}{% empty items and spaces are ok
1838     \advance\count@\@ne
1839     \toks@\expandafter{\bbl@tempa}%
1840     \bbl@exp{%
1841       \\SetString\bbl@templ{\romannumeral\count@}{\the\toks@}%
1842       \count@=\the\count@\relax}}}%
1843 <</Macros local to BabelCommands>>

```

Delaying code Now the definition of `\AfterBabelCommands` when it is activated.

```

1844 \def\bbl@aftercmds#1{%
1845   \toks@\expandafter{\bbl@scafter#1}%
1846   \xdef\bbl@scafter{\the\toks@}}

```

Case mapping The command `\SetCase` is deprecated. Currently it consists in a definition with a hack just for backward compatibility in the macro mapping.

```

1847 <<*Macros local to BabelCommands>> ≡
1848 \newcommand\SetCase[3][]{%

4.15. Making glyphs available

This section makes a number of glyphs available that either do not exist in the OT1 encoding and have to be ‘faked’, or that are not accessible through Tlenc.def.

\set@low@box The following macro is used to lower quotes to the same level as the comma. It prepares its argument in box register 0.

```

1959 \bbl@trace{Macros related to glyphs}
1960 \def\set@low@box#1{\setbox\tw@hbox{,}\setbox\z@hbox{#1}%
1961     \dimen\z@ht\z@ \advance\dimen\z@ -\ht\tw@%
1962     \setbox\z@hbox{\lower\dimen\z@ \box\z@}\ht\z@\ht\tw@ \dp\z@\dp\tw@}

```

\save@sf@q The macro \save@sf@q is used to save and reset the current space factor.

```

1963 \def\save@sf@q#1{\leavevmode
1964     \begingroup
1965     \edef\@SF{\spacefactor\the\spacefactor}#1\@SF
1966     \endgroup}

```

4.15.1. Quotation marks

\quotedblbase In the T1 encoding the opening double quote at the baseline is available as a separate character, accessible via \quotedblbase. In the OT1 encoding it is not available, therefore we make it available by lowering the normal open quote character to the baseline.

```

1967 \ProvideTextCommand{\quotedblbase}{OT1}{%

```

```

1968 \save@sf@q{\set@low@box{\textquotedblright\}}%
1969 \box\z@\kern-.04em\bbl@allowhyphens}}

```

Make sure that when an encoding other than OT1 or T1 is used this glyph can still be typeset.

```

1970 \ProvideTextCommandDefault{\quotedblbase}{%
1971 \UseTextSymbol{OT1}{\quotedblbase}}

```

\quotesinglbase We also need the single quote character at the baseline.

```

1972 \ProvideTextCommand{\quotesinglbase}{OT1}{%
1973 \save@sf@q{\set@low@box{\textquoteright\}}%
1974 \box\z@\kern-.04em\bbl@allowhyphens}}

```

Make sure that when an encoding other than OT1 or T1 is used this glyph can still be typeset.

```

1975 \ProvideTextCommandDefault{\quotesinglbase}{%
1976 \UseTextSymbol{OT1}{\quotesinglbase}}

```

\guillemetleft

\guillemetright The guillemet characters are not available in OT1 encoding. They are faked. (Wrong names with o preserved for compatibility.)

```

1977 \ProvideTextCommand{\guillemetleft}{OT1}{%
1978 \ifmmode
1979 \ll
1980 \else
1981 \save@sf@q{\nobreak
1982 \raise.2ex\hbox{$\scriptscriptstyle\ll$}\bbl@allowhyphens}%
1983 \fi}
1984 \ProvideTextCommand{\guillemetright}{OT1}{%
1985 \ifmmode
1986 \gg
1987 \else
1988 \save@sf@q{\nobreak
1989 \raise.2ex\hbox{$\scriptscriptstyle\gg$}\bbl@allowhyphens}%
1990 \fi}
1991 \ProvideTextCommand{\guillemotleft}{OT1}{%
1992 \ifmmode
1993 \ll
1994 \else
1995 \save@sf@q{\nobreak
1996 \raise.2ex\hbox{$\scriptscriptstyle\ll$}\bbl@allowhyphens}%
1997 \fi}
1998 \ProvideTextCommand{\guillemotright}{OT1}{%
1999 \ifmmode
2000 \gg
2001 \else
2002 \save@sf@q{\nobreak
2003 \raise.2ex\hbox{$\scriptscriptstyle\gg$}\bbl@allowhyphens}%
2004 \fi}

```

Make sure that when an encoding other than OT1 or T1 is used these glyphs can still be typeset.

```

2005 \ProvideTextCommandDefault{\guillemetleft}{%
2006 \UseTextSymbol{OT1}{\guillemetleft}}
2007 \ProvideTextCommandDefault{\guillemetright}{%
2008 \UseTextSymbol{OT1}{\guillemetright}}
2009 \ProvideTextCommandDefault{\guillemotleft}{%
2010 \UseTextSymbol{OT1}{\guillemotleft}}
2011 \ProvideTextCommandDefault{\guillemotright}{%
2012 \UseTextSymbol{OT1}{\guillemotright}}

```

\guilsinglleft

\guilsinglright The single guillemets are not available in OT1 encoding. They are faked.

```
2013 \ProvideTextCommand{\guilsinglleft}{OT1}{%
2014   \ifmmode
2015     <%
2016   \else
2017     \save@sf@q{\nobreak
2018       \raise.2ex\hbox{$\scriptscriptstyle<$}\bbl@allowhyphens}%
2019   \fi}
2020 \ProvideTextCommand{\guilsinglright}{OT1}{%
2021   \ifmmode
2022     >%
2023   \else
2024     \save@sf@q{\nobreak
2025       \raise.2ex\hbox{$\scriptscriptstyle>$}\bbl@allowhyphens}%
2026   \fi}
```

Make sure that when an encoding other than OT1 or T1 is used these glyphs can still be typeset.

```
2027 \ProvideTextCommandDefault{\guilsinglleft}{%
2028   \UseTextSymbol{OT1}{\guilsinglleft}}
2029 \ProvideTextCommandDefault{\guilsinglright}{%
2030   \UseTextSymbol{OT1}{\guilsinglright}}
```

4.15.2. Letters

\ij

\IJ The dutch language uses the letter ‘ij’. It is available in T1 encoded fonts, but not in the OT1 encoded fonts. Therefore we fake it for the OT1 encoding.

```
2031 \DeclareTextCommand{\ij}{OT1}{%
2032   i\kern-0.02em\bbl@allowhyphens j}
2033 \DeclareTextCommand{\IJ}{OT1}{%
2034   I\kern-0.02em\bbl@allowhyphens J}
2035 \DeclareTextCommand{\ij}{T1}{\char188}
2036 \DeclareTextCommand{\IJ}{T1}{\char156}
```

Make sure that when an encoding other than OT1 or T1 is used these glyphs can still be typeset.

```
2037 \ProvideTextCommandDefault{\ij}{%
2038   \UseTextSymbol{OT1}{\ij}}
2039 \ProvideTextCommandDefault{\IJ}{%
2040   \UseTextSymbol{OT1}{\IJ}}
```

\dj

\DJ The croatian language needs the letters \dj and \DJ; they are available in the T1 encoding, but not in the OT1 encoding by default.

Some code to construct these glyphs for the OT1 encoding was made available to me by Stipčević Mario, (stipcevic@olimp.irb.hr).

```
2041 \def\crrtic@{\hrule height0.1ex width0.3em}
2042 \def\crrtic@{\hrule height0.1ex width0.33em}
2043 \def\ddj@{%
2044   \setbox0\hbox{d}\dimen@=\ht0
2045   \advance\dimen@lex
2046   \dimen@.45\dimen@
2047   \dimen@ii\expandafter\rem@pt\the\fontdimen\@ne\font\dimen@
2048   \advance\dimen@ii.5ex
2049   \leavevmode\rlap{\raise\dimen@\hbox{\kern\dimen@ii\vbox{\crrtic@}}}}
2050 \def\DDJ@{%
2051   \setbox0\hbox{D}\dimen@=.55\ht0
2052   \dimen@ii\expandafter\rem@pt\the\fontdimen\@ne\font\dimen@
2053   \advance\dimen@ii.15ex % correction for the dash position

2055   \dimen\thr@@\expandafter\rem@pt\the\fontdimen7\font\dimen@
2056   \leavevmode\rlap{\raise\dimen@\hbox{\kern\dimen@ii\vbox{\crrtic@}}}}
2057 %
```

```

2058 \DeclareTextCommand{\dj}{OT1}{\ddj@ d}
2059 \DeclareTextCommand{\DJ}{OT1}{\DDJ@ D}

```

Make sure that when an encoding other than OT1 or T1 is used these glyphs can still be typeset.

```

2060 \ProvideTextCommandDefault{\dj}{%
2061   \UseTextSymbol{OT1}{\dj}}
2062 \ProvideTextCommandDefault{\DJ}{%
2063   \UseTextSymbol{OT1}{\DJ}}

```

\SS For the T1 encoding \SS is defined and selects a specific glyph from the font, but for other encodings it is not available. Therefore we make it available here.

```

2064 \DeclareTextCommand{\SS}{OT1}{SS}
2065 \ProvideTextCommandDefault{\SS}{\UseTextSymbol{OT1}{\SS}}

```

4.15.3. Shorthands for quotation marks

Shorthands are provided for a number of different quotation marks, which make them usable both outside and inside mathmode. They are defined with `\ProvideTextCommandDefault`, but this is very likely not required because their definitions are based on encoding-dependent macros.

\glq

\grq The ‘german’ single quotes.

```

2066 \ProvideTextCommandDefault{\glq}{%
2067   \textormath{\quotesinglbase}{\mbox{\quotesinglbase}}}

```

The definition of `\grq` depends on the fontencoding. With T1 encoding no extra kerning is needed.

```

2068 \ProvideTextCommand{\grq}{T1}{%
2069   \textormath{\kern\z@\textquoteleft}{\mbox{\textquoteleft}}}
2070 \ProvideTextCommand{\grq}{TU}{%
2071   \textormath{\textquoteleft}{\mbox{\textquoteleft}}}
2072 \ProvideTextCommand{\grq}{OT1}{%
2073   \save@sf@q{\kern-.0125em
2074     \textormath{\textquoteleft}{\mbox{\textquoteleft}}}%
2075     \kern.07em\relax}}
2076 \ProvideTextCommandDefault{\grq}{\UseTextSymbol{OT1}\grq}

```

\glqq

\grqq The ‘german’ double quotes.

```

2077 \ProvideTextCommandDefault{\glqq}{%
2078   \textormath{\quotedblbase}{\mbox{\quotedblbase}}}

```

The definition of `\grqq` depends on the fontencoding. With T1 encoding no extra kerning is needed.

```

2079 \ProvideTextCommand{\grqq}{T1}{%
2080   \textormath{\textquotedblleft}{\mbox{\textquotedblleft}}}
2081 \ProvideTextCommand{\grqq}{TU}{%
2082   \textormath{\textquotedblleft}{\mbox{\textquotedblleft}}}
2083 \ProvideTextCommand{\grqq}{OT1}{%
2084   \save@sf@q{\kern-.07em
2085     \textormath{\textquotedblleft}{\mbox{\textquotedblleft}}}%
2086     \kern.07em\relax}}
2087 \ProvideTextCommandDefault{\grqq}{\UseTextSymbol{OT1}\grqq}

```

\flq

\frq The ‘french’ single guillemets.

```

2088 \ProvideTextCommandDefault{\flq}{%
2089   \textormath{\guilsinglleft}{\mbox{\guilsinglleft}}}
2090 \ProvideTextCommandDefault{\frq}{%
2091   \textormath{\guilsinglright}{\mbox{\guilsinglright}}}

```

\flqq

\frqq The ‘french’ double guillemets.

```
2092 \ProvideTextCommandDefault{\flqq}{%
2093   \textormath{\guillemetleft}{\mbox{\guillemetleft}}}
2094 \ProvideTextCommandDefault{\frqq}{%
2095   \textormath{\guillemetright}{\mbox{\guillemetright}}}
```

4.15.4. Umlauts and tremas

The command `\` needs to have a different effect for different languages. For German for instance, the ‘umlaut’ should be positioned lower than the default position for placing it over the letters a, o, u, A, O and U. When placed over an e, i, E or I it can retain its normal position. For Dutch the same glyph is always placed in the lower position.

\umlauthigh

\umlautlow To be able to provide both positions of `\` we provide two commands to switch the positioning, the default will be `\umlauthigh` (the normal positioning).

```
2096 \def\umlauthigh{%
2097   \def\bbl@umlauta##1{\leavevmode\bgroup%
2098     \accent\csname f@encoding dqpos\endcsname
2099     ##1\bbl@allowhyphens\egroup}%
2100   \let\bbl@umlaute\bbl@umlauta}
2101 \def\umlautlow{%
2102   \def\bbl@umlauta{\protect\lower@umlaut}}
2103 \def\umlautelow{%
2104   \def\bbl@umlaute{\protect\lower@umlaut}}
2105 \umlauthigh
```

\lower@umlaut Used to position the `\` closer to the letter. We want the umlaut character lowered, nearer to the letter. To do this we need an extra *<dimen>* register.

```
2106 \expandafter\ifx\csname U@D\endcsname\relax
2107   \csname newdimen\endcsname U@D
2108 \fi
```

The following code fools TeX’s `make_accent` procedure about the current x-height of the font to force another placement of the umlaut character. First we have to save the current x-height of the font, because we’ll change this font dimension and this is always done globally.

Then we compute the new x-height in such a way that the umlaut character is lowered to the base character. The value of `.45ex` depends on the METAFONT parameters with which the fonts were built. (Just try out, which value will look best.) If the new x-height is too low, it is not changed. Finally we call the `\accent` primitive, reset the old x-height and insert the base character in the argument.

```
2109 \def\lower@umlaut#1{%
2110   \leavevmode\bgroup
2111   \U@D lex%
2112   {\setbox\z@\hbox{%
2113     \char\csname f@encoding dqpos\endcsname}%
2114     \dimen@ -.45ex\advance\dimen@\ht\z@
2115     \ifdim lex<\dimen@ \fontdimen5\font\dimen@ \fi}%
2116   \accent\csname f@encoding dqpos\endcsname
2117   \fontdimen5\font\U@D #1%
2118   \egroup}
```

For all vowels we declare `\` to be a composite command which uses `\bbl@umlauta` or `\bbl@umlaute` to position the umlaut character. We need to be sure that these definitions override the ones that are provided when the package `fontenc` with option `OT1` is used. Therefore these declarations are postponed until the beginning of the document. Note these definitions only apply to some languages, but `babel` sets them for *all* languages – you may want to redefine `\bbl@umlauta` and/or `\bbl@umlaute` for a language in the corresponding `ldf` (using the `babel` switching mechanism, of course).

```
2119 \AtBeginDocument{%
2120   \DeclareTextCompositeCommand{\}{OT1}{a}{\bbl@umlauta{a}}%
2121   \DeclareTextCompositeCommand{\}{OT1}{e}{\bbl@umlaute{e}}%
2122   \DeclareTextCompositeCommand{\}{OT1}{i}{\bbl@umlaute{i}}%
```

```

2123 \DeclareTextCompositeCommand{"}{OT1}{i}{\bbl@umlaute{i}}%
2124 \DeclareTextCompositeCommand{"}{OT1}{o}{\bbl@umlauta{o}}%
2125 \DeclareTextCompositeCommand{"}{OT1}{u}{\bbl@umlauta{u}}%
2126 \DeclareTextCompositeCommand{"}{OT1}{A}{\bbl@umlauta{A}}%
2127 \DeclareTextCompositeCommand{"}{OT1}{E}{\bbl@umlaute{E}}%
2128 \DeclareTextCompositeCommand{"}{OT1}{I}{\bbl@umlaute{I}}%
2129 \DeclareTextCompositeCommand{"}{OT1}{O}{\bbl@umlauta{O}}%
2130 \DeclareTextCompositeCommand{"}{OT1}{U}{\bbl@umlauta{U}}%

```

Finally, make sure the default hyphenrules are defined (even if empty). For internal use, another empty `\language` is defined. Currently used in Amharic.

```

2131 \ifx\l@english\@undefined
2132 \chardef\l@english\z@
2133 \fi
2134 % The following is used to cancel rules in ini files (see Amharic).
2135 \ifx\l@unhyphenated\@undefined
2136 \newlanguage\l@unhyphenated
2137 \fi

```

4.16. Layout

Layout is mainly intended to set bidi documents, but there is at least a tool useful in general.

```

2138 \bbl@trace{Bidi layout}
2139 \providecommand\IfBabelLayout[3]{#3}%

```

4.17. Load engine specific macros

Some macros are not defined in all engines, so, after loading the files define them if necessary to raise an error.

```

2140 \bbl@trace{Input engine specific macros}
2141 \ifcase\bbl@engine
2142 \input txtbabel.def
2143 \or
2144 \input luababel.def

2153 \let\babelcharproperty\babelprehyphenation
2154 \fi
2155 </package | core>

```

4.18. Creating and modifying languages

Continue with \LaTeX only.

`\babelprovide` is a general purpose tool for creating and modifying languages. It creates the language infrastructure, and loads, if requested, an ini file. It may be used in conjunction to previously loaded ldf files.

```

2156 < *package >
2157 \bbl@trace{Creating languages and reading ini files}

4.19. Main loop in ‘provide’

Now, the ‘main loop’, which ****must be executed inside a group****. At this point, \bbl@inidata may contain data declared in \babelprovide, with ‘slashed’ keys. There are 3 steps: first read the ini file and store it; then traverse the stored values, and process some groups if required (date, captions, labels, counters); finally, ‘export’ some values by defining global macros (identification, typography, characters, numbers). The second argument is 0 when called to read the minimal data for fonts; with \babelprovide it’s either 1 or 2.

```

A key with a slash in \babelprovide replaces the value in the ini file (which is ignored altogether). The mechanism is simple (but suboptimal): add the data to the ini one (at this point the ini file has not yet been read), and define a dummy macro. When the ini file is read, just skip the corresponding key and reset the macro (in \bbl@inistore above).

```

Key-value pairs are treated differently depending on the section in the ini file. The following macros are the readers for identification and typography. Note \bbl@ini@exports is called always (via \bbl@inisec), while \bbl@after@ini must be called explicitly after \bbl@read@ini if necessary.

Although BCP 47 doesn't treat '-x-' as an extension, the CLDR and many other sources do (as a *private use extension*). For consistency with other single-letter subtags or 'singletons', here is considered an extension, too.

To show correctly some captions in a few languages, we need to patch some internal macros, because the order is hardcoded. For example, in Japanese the chapter number is surrounded by two string, while in Hungarian is placed after. These replacement works in many classes, but not all. Actually, the following lines are somewhat tentative.

```

```

Dates will require some macros for the basic formatting. They may be redefined by language, so “semi-public” names (camel case) are used. Oddly enough, the CLDR places particles like “de” inconsistently in either in the date or in the month name. Note after `\bbl@replace \toks@` contains the resulting string, which is used by `\bbl@replace@finish@iii` (this implicit behavior doesn't seem a good idea, but it's efficient).

```

```

The following ini reader ignores everything but the identification section. It is called when a font is defined (ie, when the language is first selected) to know which script/language must be enabled. This means we must make sure a few characters are not active. The ini is not read directly,

but with a proxy tex file named as the language (which means any code in it must be skipped, too).

```

3202 \def\bbl@load@info#1{%
3203   \def\BabelBeforeIni##1##2{%

3207       \endgroup}%         boxed, to avoid extra spaces:
3208   {\bbl@input@texini{##1}}}
```

4.23. Numerals

A tool to define the macros for native digits from the list provided in the ini file. Somewhat convoluted because there are 10 digits, but only 9 arguments in T_EX. Non-digits characters are kept. The first macro is the generic “localized” command.

```

3209 \def\bbl@setdigits#1#2#3#4#5{%

3246       \toks@\expandafter{\the\toks@\or #1}%
3247       \expandafter\bbl@buildifcase
3248     \fi}
```

The code for additive counters is somewhat tricky and it's based on the fact the arguments just before @@ collect digits which have been left ‘unused’ in previous arguments, the first of them being the number of digits in the number to be converted. This explains the reverse set 76543210. Digits above 10000 are not handled yet. When the key contains the subkey .F., the number after is treated as an special case, for a fixed form (see babel-he.ini, for example).

```

5.1. Cross referencing macros

The \LaTeX book states:

The *key* argument is any sequence of letters, digits, and punctuation symbols; upper- and lowercase letters are regarded as different.

When the above quote should still be true when a document is typeset in a language that has active characters, special care has to be taken of the category codes of these characters when they appear in an argument of the cross referencing macros.

When a cross referencing command processes its argument, all tokens in this argument should be character tokens with category ‘letter’ or ‘other’.

The following package options control which macros are to be redefined.

```

3560 <<{*More package options}>> ≡
3561 \DeclareOption{safe=none}{\let\bbl@opt@safe\@empty}
3562 \DeclareOption{safe=bib}{\def\bbl@opt@safe{B}}
3563 \DeclareOption{safe=ref}{\def\bbl@opt@safe{R}}
3564 \DeclareOption{safe=refbib}{\def\bbl@opt@safe{BR}}
3565 \DeclareOption{safe=bibref}{\def\bbl@opt@safe{BR}}
3566 <</More package options>>

```

\@newl@bel First we open a new group to keep the changed setting of `\protect` local and then we set the `@safe@actives` switch to true to make sure that any shorthand that appears in any of the arguments immediately expands to its non-active self.

```

3567 \bbl@trace{Cross referencing macros}
3568 \ifx\bbl@opt@safe\@empty\else % ie, if 'ref' and/or 'bib'
3569   \def\@newl@bel#1#2#3{%
3570     {\@safe@activetrue
3571       \bbl@ifunset{#1@#2}%
3572       \relax
3573       {\gdef\@multiplelabels{%
3574         \@latex@warning@no@line{There were multiply-defined labels}}%
3575       \@latex@warning@no@line{Label `#2' multiply defined}}%
3576     \global\@namedef{#1@#2}{#3}}

```

\@testdef An internal \LaTeX macro used to test if the labels that have been written on the `.aux` file have changed. It is called by the `\enddocument` macro.

```

3577 \CheckCommand*\@testdef[3]{%
3578   \def\reserved@a{#3}%
3579   \expandafter\ifx\c@name#1@#2\endcsname\reserved@a

```

```

3580 \else
3581 \@tempwattrue
3582 \fi}

```

Now that we made sure that \@testdef still has the same definition we can rewrite it. First we make the shorthands ‘safe’. Then we use \bbl@tempa as an ‘alias’ for the macro that contains the label which is being checked. Then we define \bbl@tempb just as \@newl@bel does it. When the label is defined we replace the definition of \bbl@tempa by its meaning. If the label didn’t change, \bbl@tempa and \bbl@tempb should be identical macros.

```

3583 \def\@testdef#1#2#3{% TODO. With @samestring?
3584 \@safe@activestrue
3585 \expandafter\let\expandafter\bbl@tempa\csname #1@#2\endcsname
3586 \def\bbl@tempb{#3}%
3587 \@safe@activestrue
3588 \ifx\bbl@tempa\relax
3589 \else
3590 \edef\bbl@tempa{\expandafter\strip@prefix\meaning\bbl@tempa}%
3591 \fi
3592 \edef\bbl@tempb{\expandafter\strip@prefix\meaning\bbl@tempb}%
3593 \ifx\bbl@tempa\bbl@tempb
3594 \else
3595 \@tempwattrue
3596 \fi}
3597 \fi

```

\ref

\pageref The same holds for the macro \ref that references a label and \pageref to reference a page. We make them robust as well (if they weren’t already) to prevent problems if they should become expanded at the wrong moment.

```

3598 \bbl@xin@{R}\bbl@opt@safe
3599 \ifin@
3600 \edef\bbl@tempc{\expandafter\string\csname ref code\endcsname}%
3601 \bbl@xin@{\expandafter\strip@prefix\meaning\bbl@tempc}%

3616 \@safe@activestrue\org@pageref{#1}\@safe@activestrue}
3617 \fi
3618 \else
3619 \let\org@ref\ref
3620 \let\org@pageref\pageref
3621 \fi

```

\@citex The macro used to cite from a bibliography, \cite, uses an internal macro, \@citex. It is this internal macro that picks up the argument(s), so we redefine this internal macro and leave \cite alone. The first argument is used for typesetting, so the shorthands need only be deactivated in the second argument.

```

3622 \bbl@xin@{B}\bbl@opt@safe
3623 \ifin@
3624 \bbl@redefine\@citex[#1]#2{%
3625 \@safe@activestrue\edef\bbl@tempa{#2}\@safe@activestrue}

```

```
3626 \org@citex[#1]{\bbl@tempa}}
```

Unfortunately, the packages `natbib` and `cite` need a different definition of `\@citex`... To begin with, `natbib` has a definition for `\@citex` with *three* arguments... We only know that a package is loaded when `\begin{document}` is executed, so we need to postpone the different redefinition.

Notice that we use `\def` here instead of `\bbl@redefine` because `\org@citex` is already defined and we don't want to overwrite that definition (it would result in parameter stack overflow because of a circular definition).

(Recent versions of `natbib` change dynamically `\@citex`, so PR4087 doesn't seem fixable in a simple way. Just load `natbib` before.)

```
3627 \AtBeginDocument{%
3628   \@ifpackageloaded{natbib}{%
3629     \def\@citex[#1][#2]#3{%
3630       \@safe@activetrue\edef\bbl@tempa{#3}\@safe@activesfalse
3631       \org@citex[#1][#2]{\bbl@tempa}}%
3632   }{}}
```

The package `cite` has a definition of `\@citex` where the shorthands need to be turned off in both arguments.

```
3633 \AtBeginDocument{%
3634   \@ifpackageloaded{cite}{%
3635     \def\@citex[#1]#2{%
3636       \@safe@activetrue\org@citex[#1]{#2}\@safe@activesfalse}%
3637   }{}}
```

\nocite The macro `\nocite` which is used to instruct BiBTeX to extract uncited references from the database.

```
3638 \bbl@redefine\nocite#1{%
3639   \@safe@activetrue\org@nocite{#1}\@safe@activesfalse}
```

\bibcite The macro that is used in the `.aux` file to define citation labels. When packages such as `natbib` or `cite` are not loaded its second argument is used to typeset the citation label. In that case, this second argument can contain active characters but is used in an environment where `\@safe@activetrue` is in effect. This switch needs to be reset inside the `\hbox` which contains the citation label. In order to determine during `.aux` file processing which definition of `\bibcite` is needed we define `\bibcite` in such a way that it redefines itself with the proper definition. We call `\bbl@cite@choice` to select the proper definition for `\bibcite`. This new definition is then activated.

```
3640 \bbl@redefine\bibcite{%
3641   \bbl@cite@choice
3642   \bibcite}
```

\bbl@bibcite The macro `\bbl@bibcite` holds the definition of `\bibcite` needed when neither `natbib` nor `cite` is loaded.

```
3643 \def\bbl@bibcite#1#2{%
3644   \org@bibcite{#1}{\@safe@activesfalse#2}}
```

\bbl@cite@choice The macro `\bbl@cite@choice` determines which definition of `\bibcite` is needed. First we give `\bibcite` its default definition.

```
3645 \def\bbl@cite@choice{%
3646   \global\let\bibcite\bbl@bibcite
3647   \@ifpackageloaded{natbib}{\global\let\bibcite\org@bibcite}{%
3648   \@ifpackageloaded{cite}{\global\let\bibcite\org@bibcite}{%
3649   \global\let\bbl@cite@choice\relax}
```

When a document is run for the first time, no `.aux` file is available, and `\bibcite` will not yet be properly defined. In this case, this has to happen before the document starts.

```
3650 \AtBeginDocument{\bbl@cite@choice}
```

\@bibitem One of the two internal \TeX macros called by `\bibitem` that write the citation label on the `.aux` file.

```

3651 \bbl@redefine\@bibitem#1{%
3652   \safe@activetrue\org@bibitem{#1}\safe@activesfalse}
3653 \else
3654   \let\org@nocite\nocite
3655   \let\org@@citex@citex
3656   \let\org@bibcite\bibcite
3657   \let\org@bibitem\@bibitem
3658 \fi

```

5.2. Layout

```

3659 \newcommand\BabelPatchSection[1]{%

3690 \IfBabelLayout{captions}%
3691   {\BabelPatchSection{caption}}}%

```

5.3. Marks

\markright Because the output routine is asynchronous, we must pass the current language attribute to the head lines. To achieve this we need to adapt the definition of `\markright` and `\markboth` somewhat. However, headlines and footlines can contain text outside marks; for that we must take some actions in the output routine if the 'headfoot' options is used.

We need to make some redefinitions to the output routine to avoid an endless loop and to correctly handle the page number in bidi documents.

```

3692 \bbl@trace{Marks}
3693 \IfBabelLayout{sectioning}
3694   {\ifx\bbl@opt@headfoot\@nnil
3695     \g@addto@macro\@resetactivechars{%
3696       \set@typeset@protect
3697       \expandafter\select@language@x\expandafter{\bbl@main@language}%
3698       \let\protect\noexpand
3699       \ifcase\bbl@bidimode\else % Only with bidi. See also above

```

```

3700         \edef\thepage{%
3701             \noexpand\babelsublr{\unexpanded\expandafter{\thepage}}}%
3702         \fi}%
3703     \fi}
3704     {\ifbbl@single\else
3705         \bbl@ifunset{markright } \bbl@redefine\bbl@redefineroobust
3706         \markright#1{%
3707             \bbl@ifblank{#1}%
3708             {\org@markright{}}%
3709             {\toks@{#1}%
3710             \bbl@exp{%
3711                 \\org@markright{\\protect\\foreignlanguage{\language}%
3712                 {\protect\\bbl@restore@actives\the\toks@}}}%

```

\markboth

\@mkboth The definition of `\markboth` is equivalent to that of `\markright`, except that we need two token registers. The documentclasses report and book define and set the headings for the page. While doing so they also store a copy of `\markboth` in `\@mkboth`. Therefore we need to check whether `\@mkboth` has already been set. If so we need to do that again with the new definition of `\markboth`. (As of Oct 2019, \TeX stores the definition in an intermediate macro, so it's not necessary anymore, but it's preserved for older versions.)

```

3713     \ifx\@mkboth\markboth
3714         \def\bbl@tempc{\let\@mkboth\markboth}%
3715     \else

3729                 \bbl@exp{\\org@markboth{\the\toks@}{\the\@temptokena}}}%
3730                 \bbl@tempc
3731             \fi} % end ifbbl@single, end \IfBabelLayout

```

5.4. Other packages

5.4.1. ifthen

\ifthenelse Sometimes a document writer wants to create a special effect depending on the page a certain fragment of text appears on. This can be achieved by the following piece of code:

```

% \ifthenelse{\isodd{\pageref{some-label}}}
%         {code for odd pages}
%         {code for even pages}
%

```

In order for this to work the argument of `\isodd` needs to be fully expandable. With the above redefinition of `\pageref` it is not in the case of this example. To overcome that, we add some code to the definition of `\ifthenelse` to make things work.

We want to revert the definition of `\pageref` and `\ref` to their original definition for the first argument of `\ifthenelse`, so we first need to store their current meanings.

Then we can set the `\@safe@actives` switch and call the original `\ifthenelse`. In order to be able to use shorthands in the second and third arguments of `\ifthenelse` the resetting of the switch *and* the definition of `\pageref` happens inside those arguments.

```

3732 \bbl@trace{Preventing clashes with other packages}

```

```

3733 \ifx\org@ref\@undefined\else
3734 \bbl@xin@{R}\bbl@opt@safe
3735 \ifin@
3736 \AtBeginDocument{%
3737 \ifpackageloaded{ifthen}{%
3738 \bbl@redefine@long\ifthenelse#1#2#3{%
3739 \let\bbl@temp@pref\pageref
3740 \let\pageref\org@pageref
3741 \let\bbl@temp@ref\ref
3742 \let\ref\org@ref
3743 \@safe@activestrue
3744 \org@ifthenelse{#1}%
3745 {\let\pageref\bbl@temp@pref
3746 \let\ref\bbl@temp@ref
3747 \@safe@activesfalse
3748 #2}%
3749 {\let\pageref\bbl@temp@pref
3750 \let\ref\bbl@temp@ref
3751 \@safe@activesfalse
3752 #3}%
3753 }%
3754 }{}%
3755 }
3756 \fi

```

5.4.2. varioref

\@@vpageref

\vrefpagenum

\Ref When the package varioref is in use we need to modify its internal command \@@vpageref in order to prevent problems when an active character ends up in the argument of \vref. The same needs to happen for \vrefpagenum.

```

3757 \AtBeginDocument{%
3758 \ifpackageloaded{varioref}{%
3759 \bbl@redefine\@@vpageref#1[#2]#3{%
3760 \@safe@activestrue
3761 \org@@@vpageref{#1}[#2]#3}%
3762 \@safe@activesfalse}%
3763 \bbl@redefine\vrefpagenum#1#2{%
3764 \@safe@activestrue
3765 \org@vrefpagenum{#1}#2}%
3766 \@safe@activesfalse}%

```

The package varioref defines \Ref to be a robust command which uppercases the first character of the reference text. In order to be able to do that it needs to access the expandable form of \ref. So we employ a little trick here. We redefine the (internal) command \Ref_ to call \org@ref instead of \ref. The disadvantage of this solution is that whenever the definition of \Ref changes, this definition needs to be updated as well.

```

3767 \expandafter\def\csname Ref \endcsname#1{%
3768 \protected@edef\@tempa{\org@ref{#1}}\expandafter\MakeUppercase\@tempa}
3769 }{}%
3770 }
3771 \fi

```

5.4.3. hhlhline

\hhlhline Delaying the activation of the shorthand characters has introduced a problem with the hhlhline package. The reason is that it uses the ‘:’ character which is made active by the french support in babel. Therefore we need to *reload* the package when the ‘:’ is an active character. Note that this happens *after* the category code of the @-sign has been changed to other, so we need to temporarily change it to letter again.

```

3772 \AtEndOfPackage{%

```

```

3773 \AtBeginDocument{%
3774   \@ifpackageloaded{hhline}%
3775     {\expandafter\ifx\cename normal@char\string:\endcsname\relax
3776     \else
3777       \makeatletter
3778       \def\@currname{hhline}\input{hhline.sty}\makeatother
3779       \fi}%
3780   }}}

```

\substitutefontfamily *Deprecated.* It creates an .fd file on the fly. The first argument is an encoding mnemonic, the second and third arguments are font family names. Use the tools provided by \LaTeX (`\DeclareFontFamilySubstitution`).

```

3781 \def\substitutefontfamily#1#2#3{%
3782   \lowercase{\immediate\openout15=#1#2.fd\relax}%
3783   \immediate\write15{%

3790     \string\DeclareFontShape{#1}{#2}{m}{sl}{<->ssub * #3/m/sl}{}}^J
3791     \string\DeclareFontShape{#1}{#2}{m}{sc}{<->ssub * #3/m/sc}{}}^J
3792     \string\DeclareFontShape{#1}{#2}{b}{n}{<->ssub * #3/bx/n}{}}^J
3793     \string\DeclareFontShape{#1}{#2}{b}{it}{<->ssub * #3/bx/it}{}}^J
3794     \string\DeclareFontShape{#1}{#2}{b}{sl}{<->ssub * #3/bx/sl}{}}^J
3795     \string\DeclareFontShape{#1}{#2}{b}{sc}{<->ssub * #3/bx/sc}{}}^J
3796   }%
3797   \closeout15
3798 }
3799 \@onlypreamble\substitutefontfamily

```

5.5. Encoding and fonts

Because documents may use non-ASCII font encodings, we make sure that the logos of \TeX and \LaTeX always come out in the right encoding. There is a list of non-ASCII encodings. Requested encodings are currently stored in `\@fontenc@load@list`. If a non-ASCII has been loaded, we define versions of `\TeX` and `\LaTeX` for them using `\ensureascii`. The default ASCII encoding is set, too (in reverse order): the “main” encoding (when the document begins), the last loaded, or OT1.

\ensureascii

```

3800 \bbl@trace{Encoding and fonts}

3832      \DeclareTextCommandDefault{\TeX}{\ensureascii{\org@TeX}}%
3833      \DeclareTextCommandDefault{\LaTeX}{\ensureascii{\org@LaTeX}}%
3834      \fi}

```

Now comes the old deprecated stuff (with a little change in 3.9l, for fontspec). The first thing we need to do is to determine, at `\begin{document}`, which latin fontencoding to use.

\latinencoding When text is being typeset in an encoding other than ‘latin’ (OT1 or T1), it would be nice to still have Roman numerals come out in the Latin encoding. So we first assume that the current encoding at the end of processing the package is the Latin encoding.

```

3835 \AtEndOfPackage{\edef\latinencoding{\cf@encoding}}

```

But this might be overruled with a later loading of the package fontenc. Therefore we check at the execution of `\begin{document}` whether it was loaded with the T1 option. The normal way to do this (using `\@ifpackageloaded`) is disabled for this package. Now we have to revert to parsing the internal macro `\@filelist` which contains all the filenames loaded.

```

3836 \AtBeginDocument{%
3837   \@ifpackageloaded{fontspec}%
3838   {\xdef\latinencoding{%
3839     \ifx\UTFencname\@undefined
3840     EU\ifcase\bbl@engine\or2\or1\fi
3841     \else
3842     \UTFencname
3843     \fi}}%
3844   {\gdef\latinencoding{OT1}%
3845     \ifx\cf@encoding\bbl@t@one
3846     \xdef\latinencoding{\bbl@t@one}%
3847     \else
3848     \def\@elt#1{,#1,}%
3849     \edef\bbl@tempa{\expandafter\@gobbletwo\@fontenc@load@list}%
3850     \let\@elt\relax
3851     \bbl@xin@{,T1,}\bbl@tempa
3852     \ifin@
3853     \xdef\latinencoding{\bbl@t@one}%
3854     \fi
3855     \fi}}

```

\latintext Then we can define the command `\latintext` which is a declarative switch to a latin font-encoding. Usage of this macro is deprecated.

```

3856 \DeclareRobustCommand{\latintext}{%
3857   \fontencoding{\latinencoding}\selectfont
3858   \def\encodingdefault{\latinencoding}}

```

\textlatin This command takes an argument which is then typeset using the requested font encoding. In order to avoid many encoding switches it operates in a local scope.

```

3859 \ifx\@undefined\DeclareTextFontCommand
3860   \DeclareRobustCommand{\textlatin}[1]{\leavevmode{\latintext #1}}
3861 \else
3862   \DeclareTextFontCommand{\textlatin}{\latintext}
3863 \fi

```

For several functions, we need to execute some code with `\selectfont`. With \TeX 2021-06-01, there is a hook for this purpose.

```
3864 \def\bbl@patchfont#1{\AddToHook{selectfont}{#1}}
```

5.6. Basic bidi support

This code is currently placed here for practical reasons. It will be moved to the correct place soon, I hope.

It is loosely based on `rlbabel.def`, but most of it has been developed from scratch. This `babel` module (by Johannes Braams and Boris Lavva) has served the purpose of typesetting R documents for two decades, and despite its flaws I think it is still a good starting point (some parts have been copied here almost verbatim), partly thanks to its simplicity. I’ve also looked at `ARABI` (by Youssef Jabri), which is compatible with `babel`.

There are two ways of modifying macros to make them “bidi”, namely, by patching the internal low-level macros (which is what I have done with lists, columns, counters, tocs, much like `rlbabel` did), and by introducing a “middle layer” just below the user interface (sectioning, footnotes).

- `pdfTeX` provides a minimal support for bidi text, and it must be done by hand. Vertical typesetting is not possible.
- `xetex` is somewhat better, thanks to its font engine (even if not always reliable) and a few additional tools. However, very little is done at the paragraph level. Another challenging problem is text direction does not honour \TeX grouping.
- `luatex` can provide the most complete solution, as we can manipulate almost freely the node list, the generated lines, and so on, but bidi text does not work out of the box and some development is necessary. It also provides tools to properly set left-to-right and right-to-left page layouts. As `Lua \TeX -ja` shows, vertical typesetting is possible, too.

```

5.7. Local Language Configuration

\loadlocalcfg At some sites it may be necessary to add site-specific actions to a language definition file. This can be done by creating a file with the same name as the language definition file, but with the extension .cfg. For instance the file norsk.cfg will be loaded when the language definition file norsk.ldf is loaded.

For plain-based formats we don't want to override the definition of \loadlocalcfg from plain.def.

```

4032 \bbl@trace{Local Language Configuration}
4033 \ifx\loadlocalcfg@undefined
4034   \ifpackagewith{babel}{noconfigs}%
4035   {\let\loadlocalcfg@gobble}%

4040     *}}%
4041   \@empty}}
4042 \fi

```

5.8. Language options

Languages are loaded when processing the corresponding option *except* if a main language has been set. In such a case, it is not loaded until all options has been processed. The following macro inputs the ldf file and does some additional checks (\input works, too, but possible errors are not caught).

```

4043 \bbl@trace{Language options}
4044 \let\bbl@afterlang\relax
4045 \let\babelmodifiers\relax
4046 \let\bbl@loaded\@empty
4047 \def\bbl@load@language#1{%

4081 \DeclareOption{russian}{\bbl@try@load@lang{}{russianb}{}}
4082 \DeclareOption{ukrainian}{\bbl@try@load@lang{}{ukraineb}{}}
4083 \DeclareOption{uppersorbian}{\bbl@try@load@lang{}{usorbian}{}}
```

Another way to extend the list of ‘known’ options for babel was to create the file `bblopts.cfg` in which one can add option declarations. However, this mechanism is deprecated – if you want an alternative name for a language, just create a new `.ldf` file loading the actual one. You can also set the name of the file with the package option `config=<name>`, which will load `<name>.cfg` instead.

```

4084 \ifx\bbl@opt@config\@nnil
4085   \ifpackagewith{babel}{noconfigs}{}%
4086     {\InputIfFileExists{bblopts.cfg}%
4087       {\typeout{*****^J%
4088         * Local config file bblopts.cfg used^^J%
4089         *}}%
4090       {}}%
4091 \else
4092   \InputIfFileExists{\bbl@opt@config.cfg}%
4093     {\typeout{*****^J%
4094       * Local config file \bbl@opt@config.cfg used^^J%
4095       *}}%
4096     {\bbl@error{config-not-found}{}}}%
4097 \fi
```

Recognizing global options in packages not having a closed set of them is not trivial, as for them to be processed they must be defined explicitly. So, package options not yet taken into account and stored in `bbl@language@opts` are assumed to be languages. If not declared above, the names of the option and the file are the same. We first pre-process the class and package options to determine the main language, which is processed in the third ‘main’ pass, *except* if all files are `ldf` and there is no main key. In the latter case (`\bbl@opt@main` is still `\@nnil`), the traditional way to set the main language is kept — the last loaded is the main language.

For efficiency, first preprocess the class options to remove those with `=`, which are becoming increasingly frequent (no language should contain this character).

```

4098 \def\bbl@tempf{,}

4127 \fi

```

Now define the corresponding loaders. With package options, assume the language exists. With class options, check if the option is a language by checking if the corresponding file exists.

```

4128 \bbl@foreach\bbl@language@opts{%
4129 \def\bbl@tempa{#1}%
4130 \ifx\bbl@tempa\bbl@opt@main\else
4131 \ifnum\bbl@iniflag<\tw@ % 0 0 (other = ldf)

4156 \bbl@afterldf{}}}%
4157 {}%
4158 \fi
4159 \fi}

```

And we are done, because all options for this pass has been declared. Those already processed in the first pass are just ignored. There is still room for last minute changes with a `\TeX` hook (not a Babel one).

The options have to be processed in the order in which the user specified them (but remember class options are processed before):

```

4160 \NewHook{babel/presets}

```

```

4161 \UseHook{babel/presets}
4162 \def\AfterBabelLanguage#1{%
4163   \bbl@ifsamestring\CurrentOption{#1}{\global\bbl@add\bbl@afterlang}{}}
4164 \DeclareOption*{}
4165 \ProcessOptions*

```

This finished the second pass. Now the third one begins, which loads the main language set with the key main. A warning is raised if the main language is not the same as the last named one, or if the value of the key main is not a language. With some options in provide, the package luatexbase is loaded (and immediately used), and therefore \babelprovide can't go inside a \DeclareOption; this explains why it's executed directly, with a dummy declaration. Then all languages have been loaded, so we deactivate \AfterBabelLanguage.

```

6. The kernel of Babel

The kernel of the babel system is currently stored in `babel.def`. The file `babel.def` contains most of the code. The file `hyphen.cfg` is a file that can be loaded into the format, which is necessary when you want to be able to switch hyphenation patterns.

Because plain \TeX users might want to use some of the features of the babel system too, care has to be taken that plain \TeX can process the files. For this reason the current format will have to be checked in a number of places. Some of the code below is common to plain \TeX and \LaTeX , some of it is for the \LaTeX case only.

Plain formats based on `etex` (`etex`, `xetex`, `luatex`) don't load `hyphen.cfg` but `etex.src`, which follows a different naming convention, so we need to define the babel names. It presumes `language.def` exists and it is the same file used when formats were created.

A proxy file for `switch.def`

```

4219 <*kernel>
4220 \let\bbl@onlyswitch\@empty
4221 \input babel.def
4222 \let\bbl@onlyswitch\@undefined
4223 </kernel>

```

7. Error messages

They are loaded when `\bbl@error` is first called. To save space, the main code just identifies them with a tag, and messages are stored in a separate file. Since it can be loaded anywhere, you make sure some catcodes have the right value, although those for `\`, ```, `^`, `M`, `%` and `=` are reset before loading the file.

```

4416 <*patterns>

```

8. Loading hyphenation patterns

The following code is meant to be read by `iniTeX` because it should instruct `TeX` to read hyphenation patterns. To this end the `docstrip` option `patterns` is used to include this code in the file `hyphen.cfg`. Code is written with lower level macros.

```

4417 <@Make sure ProvidesFile is defined@>
4418 \ProvidesFile{hyphen.cfg}[<@date@> v<@version@> Babel hyphens]
4419 \xdef\bbl@format{\jobname}
4420 \def\bbl@version{<@version@>}
4421 \def\bbl@date{<@date@>}
4422 \ifx\AtBeginDocument\undefined
4423 \def\@empty{}
4424 \fi
4425 <@Define core switching macros@>

```

\process@line Each line in the file `language.dat` is processed by `\process@line` after it is read. The first thing this macro does is to check whether the line starts with `=`. When the first token of a line is an `=`, the macro `\process@synonym` is called; otherwise the macro `\process@language` will continue.

```

4426 \def\process@line#1#2 #3 #4 {%
4427 \ifx=#1%
4428 \process@synonym{#2}%
4429 \else
4430 \process@language{#1#2}{#3}{#4}%
4431 \fi

```

4432 \ignorespaces}

\process@synonym This macro takes care of the lines which start with an =. It needs an empty token register to begin with. \bbl@languages is also set to empty.

```
4433 \toks@{}
4434 \def\bbl@languages{}
```

When no languages have been loaded yet, the name following the = will be a synonym for hyphenation register 0. So, it is stored in a token register and executed when the first pattern file has been processed. (The \relax just helps to the \if below catching synonyms without a language.)

Otherwise the name will be a synonym for the language loaded last.

We also need to copy the hyphenmin parameters for the synonym.

```
4435 \def\process@synonym#1{%
4436   \ifnum\last@language=\m@ne
4437     \toks@\expandafter{\the\toks@\relax\process@synonym{#1}}%
4438   \else
4439     \expandafter\chardef\csname l@#1\endcsname\last@language
4440     \wlog{\string\l@#1=\string\language\the\last@language}%
4441     \expandafter\let\csname #1hyphenmins\expandafter\endcsname
4442       \csname\language\hyphenmins\endcsname
4443     \let\bbl@elt\relax
4444     \edef\bbl@languages{\bbl@languages\bbl@elt{#1}{\the\last@language}}}%
4445   \fi}
```

\process@language The macro \process@language is used to process a non-empty line from the ‘configuration file’. It has three arguments, each delimited by white space. The first argument is the ‘name’ of a language; the second is the name of the file that contains the patterns. The optional third argument is the name of a file containing hyphenation exceptions.

The first thing to do is call \addlanguage to allocate a pattern register and to make that register ‘active’. Then the pattern file is read.

For some hyphenation patterns it is needed to load them with a specific font encoding selected. This can be specified in the file language.dat by adding for instance ‘:T1’ to the name of the language. The macro \bbl@get@enc extracts the font encoding from the language name and stores it in \bbl@hyph@enc. The latter can be used in hyphenation files if you need to set a behavior depending on the given encoding (it is set to empty if no encoding is given).

Pattern files may contain assignments to \lefthyphenmin and \righthyphenmin. T_EX does not keep track of these assignments. Therefore we try to detect such assignments and store them in the \<language>hyphenmins macro. When no assignments were made we provide a default setting.

Some pattern files contain changes to the \lccode en \uccode arrays. Such changes should remain local to the language; therefore we process the pattern file in a group; the \patterns command acts globally so its effect will be remembered.

Then we globally store the settings of \lefthyphenmin and \righthyphenmin and close the group.

When the hyphenation patterns have been processed we need to see if a file with hyphenation exceptions needs to be read. This is the case when the third argument is not empty and when it does not contain a space token. (Note however there is no need to save hyphenation exceptions into the format.)

\bbl@languages saves a snapshot of the loaded languages in the form \bbl@elt{<language-name>}{<number>}{<patterns-file>}{<exceptions-file>}. Note the last 2 arguments are empty in ‘dialects’ defined in language.dat with =. Note also the language name can have encoding info.

Finally, if the counter \language is equal to zero we execute the synonyms stored.

```
4446 \def\process@language#1#2#3{%
4447   \expandafter\addlanguage\csname l@#1\endcsname
4448   \expandafter\language\csname l@#1\endcsname

```

\readconfigfile The configuration file can now be opened for reading.

```

4547 \openin1 = language.dat

```

See if the file exists, if not, use the default hyphenation file `hyphen.tex`. The user will be informed about this.

```

4548 \def\language{english}%
4549 \ifeof1
4550 \message{I couldn't find the file language.dat,\space
4551   I will try the file hyphen.tex}
4552 \input hyphen.tex\relax
4553 \chardef\l@english\z@
4554 \else

```

Pattern registers are allocated using count register `\last@language`. Its initial value is 0. The definition of the macro `\newlanguage` is such that it first increments the count register and then defines the language. In order to have the first patterns loaded in pattern register number 0 we initialize `\last@language` with the value `-1`.

```

4555 \last@language\m@ne

```

We now read lines from the file until the end is found. While reading from the input, it is useful to switch off recognition of the end-of-line character. This saves us stripping off spaces from the contents of the control sequence.

```

4556 \loop
4557   \endlinechar\m@ne
4558   \read1 to \bbl@line
4559   \endlinechar\^^M

```

If the file has reached its end, exit from the loop here. If not, empty lines are skipped. Add 3 space characters to the end of `\bbl@line`. This is needed to be able to recognize the arguments of `\process@line` later on. The default language should be the very first one.

```
4560 \if T\ifeoflF\fi T\relax
4561 \ifx\bbl@line\empty\else
4562 \edef\bbl@line{\bbl@line\space\space\space}%
4563 \expandafter\process@line\bbl@line\relax
4564 \fi
4565 \repeat
```

Check for the end of the file. We must reverse the test for `\ifeof` without `\else`. Then reactivate the default patterns, and close the configuration file.

```
4566 \begingroup
4567 \def\bbl@elt#1#2#3#4{%

Now the macros defining the font with fontspec.

When there are repeated keys in fontspec, the last value wins. So, we just place the ini settings at the beginning, and user settings will take precedence. We must deactivate temporarily `\bbl@mapselect` because `\selectfont` is called internally when a font is defined.

For historical reasons, \LaTeX can select two different series (bx and b), for what is conceptually a single one. This can lead to problems when a single family requires several fonts, depending on the language, mainly because ‘substitutions’ with some combinations are not done consistently – sometimes bx/sc is the correct font, but sometimes points to b/n, even if b/sc exists. So, some substitutions are redefined (in a somewhat hackish way, by inspecting if the variant declaration contains `>ssub*`).

```

4888 \chardef\bbl@xe@class@ignore@=4096

```

The machinery is activated with a hook (enabled only if actually used). Here `\bbl@tempc` is pre-set with `\bbl@usingxeclass`, defined below. The standard mechanism based on `\originalTeX` to save, set and restore values is used. `\count@` stores the previous char to be set, except at the beginning (0) and after `\bbl@upto`, which is the previous char negated, as a flag to mark a range.

```

4889 \AddBabelHook{babel-interchar}{beforeextras}{%
4890 \nameuse{bbl@xechars@\language}\fi}
4891 \DisableBabelHook{babel-interchar}

```

Now the two user macros. Char classes are declared implicitly, and then the macro to be executed at the `babel-interchar` hook is created. The list of chars to be handled by the hook defined above has internally the form `\bbl@usingxeclass\bbl@xe@class@punct@english\bbl@charclass{.}` `\bbl@charclass{,}` (etc.), where `\bbl@usingxeclass` stores the class to be applied to the subsequent characters. The `\ifcat` part deals with the alternative way to enter characters as macros (eg, `\}`). As a special case, hyphens are stored as `\bbl@upto`, to deal with ranges.

10.3. Layout

Note elements like headlines and margins can be modified easily with packages like fancyhdr, typearea or titleps, and geometry.

\bbl@startskip and \bbl@endskip are available to package authors. Thanks to the T_EX expansion mechanism the following constructs are valid: \advance\bbl@startskip\adim, \bbl@startskip\adim.

Consider txtbabel as a shorthand for *tex-xet babel*, which is the bidi model in both pdftex and xetex.

10.5. LuaTeX

The loader for luatex is based solely on `language.dat`, which is read on the fly. The code shouldn't be executed when the format is build, so we check if `\AddBabelHook` is defined. Then comes a modified version of the loader in `hyphen.cfg` (without the `hyphenmins` stuff, which is under the direct control of `babel`).

The names `\l@<language>` are defined and take some value from the beginning because all `ldf` files assume this for the corresponding language to be considered valid, but patterns are not loaded (except the first one). This is done later, when the language is first selected (which usually means when the `ldf` finishes). If a language has been loaded, `\bbl@hyphendata@<num>` exists (with the names of the files read).

The default setup preloads the first language into the format. This is intended mainly for 'english', so that it's available without further intervention from the user. To avoid duplicating it, the following rule applies: if the "0th" language and the first language in `language.dat` have the same name then just ignore the latter. If there are new synonymous, they are added, but note if the language patterns have not been preloaded they won't at run time.

Other preloaded languages could be read twice, if they have been preloaded into the format. This is not optimal, but it shouldn't happen very often – with luatex patterns are best loaded when the document is typeset, and the "0th" language is preloaded just for backwards compatibility.

As of 1.1b, lua(e)tex is taken into account. Formerly, loading of patterns on the fly didn't work in this format, but with the new loader it does. Unfortunately, the format is not based on `babel`, and data could be duplicated, because languages are reassigned above those in the format (nothing serious, anyway). Note even with this format `language.dat` is used (under the principle of a single source), instead of `language.def`.

Of course, there is room for improvements, like tools to read and reassign languages, which would require modifying the language list, and better error handling.

We need catcode tables, but no format (targeted by `babel`) provide a command to allocate them (although there are packages like `ctablestack`). FIX - This isn't true anymore. For the moment, a dangerous approach is used - just allocate a high random number and cross the fingers. To complicate things, `etex.sty` changes the way languages are allocated.

This files is read at three places: (1) when `plain.def`, `babel.sty` starts, to read the list of available languages from `language.dat` (for the base option); (2) at `hyphen.cfg`, to modify some macros; (3) in the middle of `plain.def` and `babel.sty`, by `babel.def`, with the commands and other definitions for luatex (eg, `\babelpatterns`).

10.6. Southeast Asian scripts

First, some general code for line breaking, used by `\babelposthyphenation`.

Replace regular (ie, implicit) discretionaries by spaceskips, based on the previous glyph (which I think makes sense, because the hyphen and the previous char go always together). Other discretionaries are not touched. See Unicode UAX 14.

10.7. CJK line breaking

Minimal line breaking for CJK scripts, mainly intended for simple documents and short texts as a secondary language. Only line breaking, with a little stretching for justification, without any attempt to adjust the spacing. It is based on (but does not strictly follow) the Unicode algorithm.

We first need a little table with the corresponding line breaking properties. A few characters have an additional key for the width (fullwidth vs. halfwidth), not yet used. There is a separate file, defined below.

```

10.9. Common stuff

```
5913 <@Font selection@>
```

10.10. Automatic fonts and ids switching

After defining the blocks for a number of scripts (must be extended and very likely fine tuned), we define a the function `Babel.locale_map`, which just traverse the node list to carry out the replacements. The table `loc_to_scr` stores the script range for each locale (whose id is the key), copied from this table (so that it can be modified on a locale basis); there is an intermediate table named `chr_to_loc` built on the fly for optimization, which maps a char to the locale. This locale is then used to get the `\language` as stored in `locale_props`, as well as the font (as requested). In the latter table a key starting with `/` maps the font from the global one (the key) to the local one (the value). Maths are skipped and discretionaries are handled in a special way.

```

Post-handling hyphenation patterns for non-standard rules, like ff to ff-f. There are still some issues with speed (not very slow, but still slow). The Lua code is below.

```

6083 \directlua{% DL7
6084   Babel.nohyphenation = \the\l@nohyphenation
6085 }

```

Now the T_EX high level interface, which requires the function defined above for converting strings to functions returning a string. These functions handle the {*n*} syntax. For example, pre={1}{1}- becomes function(*m*) return *m*[1]..*m*[1]..'-' end, where *m* are the matches returned after applying the pattern. With a mapped capture the functions are similar to function(*m*) return Babel.capt_map(*m*[1],1) end, where the last argument identifies the mapping to be applied to *m*[1]. The way it is carried out is somewhat tricky, but the effect is not dissimilar to lua load – save the code as string in a TeX macro, and expand this macro at the appropriate place. As \directlua does not take into account the current catcode of @, we just avoid this character in macro names (which explains the internal group, too).

```

```

The following experimental (and unfinished) macro applies the prehyphenation transforms for the current locale to a string (characters and spaces) and processes it in a fully expandable way (among other limitations, the string can't contain `]`). The way it operates is admittedly rather cumbersome: it converts the string to a node list, processes it, and converts it back to a string. The lua code is in the lua file below.

```

6270 \newcommand\localeprehyphenation[1]{%
6271   \directlua{ Babel.string_prehyphenation([==#1==], \the\localeid) }}

```

10.11.Bidi

As a first step, add a handler for bidi and digits (and potentially other processes) just before `luaotfload` is applied, which is loaded by default by \TeX . Just in case, consider the possibility it has not been loaded.

```

6272 \def\bbl@activate@preotf{%

6305             'luaotfload.node_processor') or nil)
6306 }

```

The basic setup. The output is modified at a very low level to set the `\bodydir` to the `\pagedir`. Sadly, we have to deal with boxes in math with basic, so the `\bbl@mathboxdir` hack is activated every math with the package option `bidi=`. The hack for the PUA is no longer necessary with basic (24.8), but it's kept in `basic-r`.

10.12 Layout

Unlike xetex, luatex requires only minimal changes for right-to-left layouts, particularly in monolingual documents (the engine itself reverses boxes – including column order or headings –, margins, etc.) with bidi=basic, without having to patch almost any macro where text direction is relevant.

Still, there are three areas deserving special attention, namely, tabular, math, and graphics, text and intrinsically left-to-right elements are intermingled. I’ve made some progress in graphics, but they’re essentially hacks; I’ve also made some progress in ‘tabular’, but when I decided to tackle

math (both standard math and ‘amsmath’) the nightmare began. I’m still not sure how ‘amsmath’ should be modified, but the main problem is that, boxes are “generic” containers that can hold text, math, and graphics (even at the same time; remember that inline math is included in the list of text nodes marked with ‘math’ (11) nodes too).

\@hangfrom is useful in many contexts and it is redefined always with the layout option.

There are, however, a number of issues when the text direction is not the same as the box direction (as set by \bodydir), and when \parbox and \hangindent are involved. Fortunately, latest releases of luatex simplify a lot the solution with \shapemode.

With the issue #15 I realized commands are best patched, instead of redefined. With a few lines, a modification could be applied to several classes and packages. Now, tabular seems to work (at least in simple cases) with array, tabularx, hhline, colortbl, longtable, booktabs, etc. However, dcolumn still fails.

```

OMEGA provided a companion to `\mathdir` (`\nextfake`) for those cases where we did not want it to be applied, so that the writing direction of the main text was left unchanged. `\bbl@nextfake` is an attempt to emulate it, because `luatex` has removed it without an alternative. Also, `\hangindent` does not honour direction changes by default, so we need to redefine `\@hangfrom`.

10.13 Lua: transforms

After declaring the table containing the patterns with their replacements, we define some auxiliary functions: `str_to_nodes` converts the string returned by a function to a node list, taking the node at base as a model (font, language, etc.); `fetch_word` fetches a series of glyphs and discretionary, which pattern is matched against (if there is a match, it is called again before trying other patterns, and this is very likely the main bottleneck).

`post_hyphenate_replace` is the callback applied after `lang.hyphenate`. This means the automatic hyphenation points are known. As empty captures return a byte position (as explained in the `luatex` manual), we must convert it to a utf8 position. With `first`, the last byte can be the leading byte in a utf8 sequence, so we just remove it and add 1 to the resulting length. With `last` we must take into account the capture position points to the next character. Here `word_head` points to the starting node of the text to be matched.

```

10.14 Lua: Auto bidi with basic and basic-r

The file babel-data-bidi.lua currently only contains data. It is a large and boring file and it is not shown here (see the generated file), but here is a sample:

```

% [0x25]={d='et'},
% [0x26]={d='on'},
% [0x27]={d='on'},
% [0x28]={d='on', m=0x29},
% [0x29]={d='on', m=0x28},
% [0x2A]={d='on'},

```

```
% [0x2B]={d='es'},
% [0x2C]={d='cs'},
%
```

For the meaning of these codes, see the Unicode standard.

Now the basic-*r* bidi mode. One of the aims is to implement a fast and simple bidi algorithm, with a single loop. I managed to do it for R texts, with a second smaller loop for a special case. The code is still somewhat chaotic, but its behavior is essentially correct. I cannot resist copying the following text from Emacs *bidi.c* (which also attempts to implement the bidi algorithm with a single loop):

Arrrrgh!! The UAX#9 algorithm is too deeply entrenched in the assumption of batch-style processing [...]. May the fleas of a thousand camels infest the armpits of those who design supposedly general-purpose algorithms by looking at their own implementations, and fail to consider other possible implementations!

Well, it took me some time to guess what the batch rules in UAX#9 actually mean (in other word, *what* they do and *why*, and not only *how*), but I think (or I hope) I've managed to understand them.

In some sense, there are two bidi modes, one for numbers, and the other for text. Furthermore, setting just the direction in R text is not enough, because there are actually *two* R modes (set explicitly in Unicode with RLM and ALM). In babel the dir is set by a higher protocol based on the language/script, which in turn sets the correct dir (<l>, <r> or <al>).

From UAX#9: "Where available, markup should be used instead of the explicit formatting characters". So, this simple version just ignores formatting characters. Actually, most of that annex is devoted to how to handle them.

BD14-BD16 are not implemented. Unicode (and the W3C) are making a great effort to deal with some special problematic cases in "streamed" plain text. I don't think this is the way to go – particular issues should be fixed by a high level interface taking into account the needs of the document. And here is where *luatex* excels, because everything related to bidi writing is under our control.

```
7542 (*basic-r)
7543 Babel.bidi_enabled = true
7544
7545 require('babel-data-bidi.lua')
7546
7547 local characters = Babel.characters
7548 local ranges = Babel.ranges
7549
7550 local DIR = node.id("dir")
7551
7552 local function dir_mark(head, from, to, outer)
7553   dir = (outer == 'r') and 'TLT' or 'TRT' -- ie, reverse
7554   local d = node.new(DIR)
7555   d.dir = '+' .. dir
7556   node.insert_before(head, from, d)
7557   d = node.new(DIR)
7558   d.dir = '-' .. dir
7559   node.insert_after(head, to, d)
7560 end
7561
7562 function Babel.bidi(head, ispar)
7563   local first_n, last_n          -- first and last char with nums
7564   local last_es                  -- an auxiliary 'last' used with nums
7565   local first_d, last_d          -- first and last char in L/R block
7566   local dir, dir_real
```

Next also depends on script/lang (<al>/<r>). To be set by babel. *tex.pardir* is dangerous, could be (re)set but it should be changed only in *vmode*. There are two strong's – *strong* = l/al/r and *strong_lr* = l/r (there must be a better way):

```
7567   local strong = ('TRT' == tex.pardir) and 'r' or 'l'
7568   local strong_lr = (strong == 'l') and 'l' or 'r'
7569   local outer = strong
7570
7571   local new_dir = false
7572   local first_dir = false
```

```

7573 local inmath = false
7574
7575 local last_lr
7576
7577 local type_n = ''
7578
7579 for item in node.traverse(head) do
7580
7581   -- three cases: glyph, dir, otherwise
7582   if item.id == node.id'glyph'
7583     or (item.id == 7 and item.subtype == 2) then
7584
7585     local itemchar
7586     if item.id == 7 and item.subtype == 2 then
7587       itemchar = item.replace.char
7588     else
7589       itemchar = item.char
7590     end
7591     local chardata = characters[itemchar]
7592     dir = chardata and chardata.d or nil
7593     if not dir then
7594       for nn, et in ipairs(ranges) do
7595         if itemchar < et[1] then
7596           break
7597         elseif itemchar <= et[2] then
7598           dir = et[3]
7599           break
7600         end
7601       end
7602     end
7603     dir = dir or 'l'
7604     if inmath then dir = ('TRT' == tex.mathdir) and 'r' or 'l' end

```

Next is based on the assumption babel sets the language *and* switches the script with its dir. We treat a language block as a separate Unicode sequence. The following piece of code is executed at the first glyph after a 'dir' node. We don't know the current language until then. This is not exactly true, as the math mode may insert explicit dirs in the node list, so, for the moment there is a hack by brute force (just above).

```

7605   if new_dir then
7606     attr_dir = 0
7607     for at in node.traverse(item.attr) do
7608       if at.number == Babel.attr_dir then
7609         attr_dir = at.value & 0x3
7610       end
7611     end
7612     if attr_dir == 1 then
7613       strong = 'r'
7614     elseif attr_dir == 2 then
7615       strong = 'al'
7616     else
7617       strong = 'l'
7618     end
7619     strong_lr = (strong == 'l') and 'l' or 'r'
7620     outer = strong_lr
7621     new_dir = false
7622   end
7623
7624   if dir == 'nsm' then dir = strong end -- W1

```

Numbers. The dual <al>/<r> system for R is somewhat cumbersome.

```

7625   dir_real = dir -- We need dir_real to set strong below
7626   if dir == 'al' then dir = 'r' end -- W3

```

By W2, there are no <en> <et> <es> if strong == <al>, only <an>. Therefore, there are not <et en> nor <en et>, W5 can be ignored, and W6 applied:

```

7627     if strong == 'al' then
7628         if dir == 'en' then dir = 'an' end          -- W2
7629         if dir == 'et' or dir == 'es' then dir = 'on' end -- W6
7630         strong_lr = 'r'                             -- W3
7631     end

```

Once finished the basic setup for glyphs, consider the two other cases: dir node and the rest.

```

7632     elseif item.id == node.id'dir' and not inmath then
7633         new_dir = true
7634         dir = nil
7635     elseif item.id == node.id'math' then
7636         inmath = (item.subtype == 0)
7637     else
7638         dir = nil          -- Not a char
7639     end

```

Numbers in R mode. A sequence of <en>, <et>, <an>, <es> and <cs> is typeset (with some rules) in L mode. We store the starting and ending points, and only when anything different is found (including nil, ie, a non-char), the textdir is set. This means you cannot insert, say, a whatsit, but this is what I would expect (with luacolor you may colorize some digits). Anyway, this behavior could be changed with a switch in the future. Note in the first branch only <an> is relevant if <al>.

```

7640     if dir == 'en' or dir == 'an' or dir == 'et' then
7641         if dir ~= 'et' then
7642             type_n = dir
7643         end
7644         first_n = first_n or item
7645         last_n = last_es or item
7646         last_es = nil
7647     elseif dir == 'es' and last_n then -- W3+W6
7648         last_es = item
7649     elseif dir == 'cs' then          -- it's right - do nothing
7650     elseif first_n then -- & if dir = any but en, et, an, es, cs, inc nil
7651         if strong_lr == 'r' and type_n ~= '' then
7652             dir_mark(head, first_n, last_n, 'r')
7653         elseif strong_lr == 'l' and first_d and type_n == 'an' then
7654             dir_mark(head, first_n, last_n, 'r')
7655             dir_mark(head, first_d, last_d, outer)
7656             first_d, last_d = nil, nil
7657         elseif strong_lr == 'l' and type_n ~= '' then
7658             last_d = last_n
7659         end
7660         type_n = ''
7661         first_n, last_n = nil, nil
7662     end

```

R text in L, or L text in R. Order of dir_ mark's are relevant: d goes outside n, and therefore it's emitted after. See dir_mark to understand why (but is the nesting actually necessary or is a flat dir structure enough?). Only L, R (and AL) chars are taken into account – everything else, including spaces, whatsits, etc., are ignored:

```

7663     if dir == 'l' or dir == 'r' then
7664         if dir ~= outer then
7665             first_d = first_d or item
7666             last_d = item
7667         elseif first_d and dir ~= strong_lr then
7668             dir_mark(head, first_d, last_d, outer)
7669             first_d, last_d = nil, nil
7670         end
7671     end

```

Mirroring. Each chunk of text in a certain language is considered a “closed” sequence. If <r on r> and <l on l>, it's clearly <r> and <l>, resptly, but with other combinations depends on outer. From all these, we select only those resolving <on> → <r>. At the beginning (when last_lr is nil) of an R text,

they are mirrored directly. Numbers in R mode are processed. It should not be done, but it doesn't hurt.

```

7672   if dir and not last_lr and dir ~= 'l' and outer == 'r' then
7673       item.char = characters[item.char] and
7674           characters[item.char].m or item.char
7675   elseif (dir or new_dir) and last_lr ~= item then
7676       local mir = outer .. strong_lr .. (dir or outer)
7677       if mir == 'rrr' or mir == 'lrr' or mir == 'rrl' or mir == 'rlr' then
7678           for ch in node.traverse(node.next(last_lr)) do
7679               if ch == item then break end
7680               if ch.id == node.id'glyph' and characters[ch.char] then
7681                   ch.char = characters[ch.char].m or ch.char
7682               end
7683           end
7684       end
7685   end

```

Save some values for the next iteration. If the current node is 'dir', open a new sequence. Since dir could be changed, strong is set with its real value (dir_real).

```

7686   if dir == 'l' or dir == 'r' then
7687       last_lr = item
7688       strong = dir_real          -- Don't search back - best save now
7689       strong_lr = (strong == 'l') and 'l' or 'r'
7690   elseif new_dir then
7691       last_lr = nil
7692   end
7693 end

```

Mirror the last chars if they are no directed. And make sure any open block is closed, too.

```

7694   if last_lr and outer == 'r' then
7695       for ch in node.traverse_id(node.id'glyph', node.next(last_lr)) do
7696           if characters[ch.char] then
7697               ch.char = characters[ch.char].m or ch.char
7698           end
7699       end
7700   end
7701   if first_n then
7702       dir_mark(head, first_n, last_n, outer)
7703   end
7704   if first_d then
7705       dir_mark(head, first_d, last_d, outer)
7706   end

```

In boxes, the dir node could be added before the original head, so the actual head is the previous node.

```

7707   return node.prev(head) or head
7708 end
7709 </basic-r>

```

And here the Lua code for bidi=basic:

```

```

11. Data for CJK

It is a boring file and it is not shown here (see the generated file), but here is a sample:

```
% [0x0021]={c='ex'},
% [0x0024]={c='pr'},
% [0x0025]={c='po'},
% [0x0028]={c='op'},
% [0x0029]={c='cp'},
% [0x002B]={c='pr'},
%
```

For the meaning of these codes, see the Unicode standard.

12. The ‘nil’ language

This ‘language’ does nothing, except setting the hyphenation patterns to nohyphenation. For this language currently no special definitions are needed or available.

The macro `\LdfInit` takes care of preventing that this file is loaded more than once, checking the category code of the `@` sign, etc.

```
8164 (*nil)
8165 \ProvidesLanguage{nil}[<@date@> v<@version@> Nil language]
8166 \LdfInit{nil}{datenil}
```

When this file is read as an option, i.e. by the `\usepackage` command, `nil` could be an ‘unknown’ language in which case we have to make it known.

```
8167 \ifx\l@nil\undefined
8168 \newlanguage\l@nil
8169 \@namedef{bbl@hyphendata@the\l@nil}{}}}% Remove warning
8170 \let\bbl@elt\relax
8171 \edef\bbl@languages{% Add it to the list of languages
8172 \bbl@languages\bbl@elt{nil}{the\l@nil}{}}
8173 \fi
```

This macro is used to store the values of the hyphenation parameters `\lefthyphenmin` and `\righthyphenmin`.

```
8174 \providehyphenmins{\CurrentOption}{\m@ne\m@ne}
```

The next step consists of defining commands to switch to (and from) the ‘nil’ language.

`\captionnil`

`\datenil`

```
8175 \let\captionnil\@empty
8176 \let\datenil\@empty
```

There is no locale file for this pseudo-language, so the corresponding fields are defined here.

```
8177 \def\bbl@inidata@nil{%

8204 \@namedef{bbl@sotf@nil}{latn}

```

The macro `\ldf@finish` takes care of looking for a configuration file, setting the main language to be switched on at `\begin{document}` and resetting the category code of `@` to its original value.

```

8205 \ldf@finish{nil}
8206 </nil>

```

13. Calendars

The code for specific calendars are placed in the specific files, loaded when requested by an ini file in the identification section with `require.calendars`.

Start with function to compute the Julian day. It's based on the little library `calendar.js`, by John Walker, in the public domain.

```

8207 <<Compute Julian day>> ≡
8208 \def\bbl@fpmo#1#2{(#1-#2*floor(#1/#2))}
8209 \def\bbl@cs@gregleap#1{%
8210   (\bbl@fpmo{#1}{4} == 0) &&
8211   (!((\bbl@fpmo{#1}{100} == 0) && (\bbl@fpmo{#1}{400} != 0)))}
8212 \def\bbl@cs@jd#1#2#3{% year, month, day
8213   \fp_eval:n{ 1721424.5 + (365 * (#1 - 1)) +
8214     floor((#1 - 1) / 4) + (-floor((#1 - 1) / 100)) +
8215     floor((#1 - 1) / 400) + floor(((367 * #2) - 362) / 12) +
8216     ((#2 <= 2) ? 0 : (\bbl@cs@gregleap{#1} ? -1 : -2)) + #3 } }
8217 <</Compute Julian day>>

```

13.1. Islamic

The code for the Civil calendar is based on it, too.

```

8218 <*ca-islamic>
8219 \ExplSyntaxOn
8220 <@Compute Julian day@>

13.2. Hebrew

This is basically the set of macros written by Michail Rozman in 1991, with corrections and adaption by Rama Porrat, Misha, Dan Haran and Boris Lavva. This must be eventually replaced by computations with l3fp. An explanation of what's going on can be found in `hebcald.sty`

13.3. Persian

There is an algorithm written in TeX by Jabri, Abolhassani, Pournader and Esfahbod, created for the first versions of the FarsiTeX system (no longer available), but the original license is GPL, so its use with LPPL is problematic. The code here follows loosely that by John Walker, which is free and accurate, but sadly very complex, so the relevant data for the years 2013-2050 have been pre-calculated and stored. Actually, all we need is the first day (either March 20 or March 21).

```

14. Support for Plain T_EX (plain.def)

14.1. Not renaming hyphen.tex

As Don Knuth has declared that the filename `hyphen.tex` may only be used to designate *his* version of the american English hyphenation patterns, a new solution has to be found in order to be able to load hyphenation patterns for other languages in a plain-based T_EX-format. When asked he responded:

That file name is “sacred”, and if anybody changes it they will cause severe upward/downward compatibility headaches.

People can have a file `localhyphen.tex` or whatever they like, but they mustn’t diddle with `hyphen.tex` (or `plain.tex` except to preload additional fonts).

The files `bplain.tex` and `blplain.tex` can be used as replacement wrappers around `plain.tex` and `lplain.tex` to achieve the desired effect, based on the `babel` package. If you load each of them with `iniTEX`, you will get a file called either `bplain.fmt` or `blplain.fmt`, which you can use as replacements for `plain.fmt` and `lplain.fmt`.

As these files are going to be read as the first thing `iniTEX` sees, we need to set some category codes just to be able to change the definition of `\input`.

```

8689 <{*bplain | blplain}
8690 \catcode`\{=1 % left brace is begin-group character
8691 \catcode`\}=2 % right brace is end-group character
8692 \catcode`\#=6 % hash mark is macro parameter character

```

If a file called `hyphen.cfg` can be found, we make sure that *it* will be read instead of the file `hyphen.tex`. We do this by first saving the original meaning of `\input` (and I use a one letter control sequence for that so as not to waste multi-letter control sequence on this in the format).

```
8693 \openin 0 hyphen.cfg
8694 \ifeof0
8695 \else
8696   \let\input
```

Then `\input` is defined to forget about its argument and load `hyphen.cfg` instead. Once that's done the original meaning of `\input` can be restored and the definition of `\a` can be forgotten.

```
8697   \def\input #1 {%
8698     \let\input\input
8699     \a hyphen.cfg
8700     \let\input\input
8701   }
8702 \fi
8703 </bplain | bplain>
```

Now that we have made sure that `hyphen.cfg` will be loaded at the right moment it is time to load `plain.tex`.

```
8704 <bplain>\a plain.tex
8705 <bplain>\a lplain.tex
```

Finally we change the contents of `\fmtname` to indicate that this is *not* the plain format, but a format based on plain with the `babel` package preloaded.

```
8706 <bplain>\def\fmtname{babel-plain}
8707 <bplain>\def\fmtname{babel-lplain}
```

When you are using a different format, based on `plain.tex` you can make a copy of `blplain.tex`, rename it and replace `plain.tex` with the name of your format file.

14.2. Emulating some \LaTeX features

The file `babel.def` expects some definitions made in the $\text{\LaTeX} 2_{\epsilon}$ style file. So, in Plain we must provide at least some predefined values as well some tools to set them (even if not all options are available). There are no package options, and therefore an alternative mechanism is provided. For the moment, only `\babeloptionstrings` and `\babeloptionmath` are provided, which can be defined before loading `babel`. `\BabelModifiers` can be set too (but not sure it works).

```
8708 <<*Emulate LaTeX>> ≡
8709 \def\@empty{}
8710 \def\loadlocalcfg#1{%
8711   \openin0#1.cfg
8712   \ifeof0
8713     \closein0
8714   \else
8715     \closein0
8716     {\immediate\writel6{*****}%
8717      \immediate\writel6{* Local config file #1.cfg used}%
8718      \immediate\writel6{*}%
8719     }
8720     \input #1.cfg\relax
8721   \fi
8722   \@endofldef}
```

14.3. General tools

A number of \LaTeX macro's that are needed later on.

8878 \fi
8879 \bbl@tempa

```

\TeX has a macro to check whether a certain package was loaded with specific options. The command has two extra arguments which are code to be executed in either the true or false case. This is used to detect whether the document needs one of the accents to be activated (activegrave and activeacute). For plain \TeX we assume that the user wants them to be active by default. Therefore the only thing we do is execute the third argument (the code for the true case).

```

8880 \def\@ifpackagewith#1#2#3#4{#3}

```

The \TeX macro `\@ifl@aded` checks whether a file was loaded. This functionality is not needed for plain \TeX but we need the macro to be defined as a no-op.

```

8881 \def\@ifl@aded#1#2#3#4{}

```

For the following code we need to make sure that the commands `\newcommand` and `\providecommand` exist with some sensible definition. They are not fully equivalent to their $\TeX 2_{\epsilon}$ versions; just enough to make things work in plain \TeX environments.

```

8882 \ifx\@tempcnta\@undefined

```

Currently we only use the \LaTeX 2\epsilon method for accents for those that are known to be made active in *some* language definition file.

```

9040 \DeclareTextAccent{"}{OT1}{127}
9041 \DeclareTextAccent{'}{OT1}{19}
9042 \DeclareTextAccent{^}{OT1}{94}
9043 \DeclareTextAccent{\`}{OT1}{18}
9044 \DeclareTextAccent{\~}{OT1}{126}

```

The following control sequences are used in `babel.def` but are not defined for PLAIN \TeX .

```

9045 \DeclareTextSymbol{\textquotedblleft}{OT1}{92}
9046 \DeclareTextSymbol{\textquotedblright}{OT1}{'\`'}
9047 \DeclareTextSymbol{\textquoteleft}{OT1}{'\`'}
9048 \DeclareTextSymbol{\textquoteright}{OT1}{'\`'}
9049 \DeclareTextSymbol{\i}{OT1}{16}
9050 \DeclareTextSymbol{\ss}{OT1}{25}

```

For a couple of languages we need the \LaTeX -control sequence `\scriptsize` to be available. Because plain \TeX doesn't have such a sophisticated font mechanism as \LaTeX has, we just `\let` it to `\sevenrm`.

```

9051 \ifx\scriptsize\undefined
9052   \let\scriptsize\sevenrm
9053 \fi

```

And a few more “dummy” definitions.

```

A proxy file:
9079 <*\plain>
9080 \input babel.def
9081 </\plain>

```

15. Acknowledgements

In the initial stages of the development of babel, Bernd Raichle provided many helpful suggestions and Michel Goossens supplied contributions for many languages. Ideas from Nico Poppelier, Piet van Oostrum and many others have been used. Paul Wackers and Werenfried Spit helped find and repair bugs.

More recently, there are significant contributions by Salim Bou, Ulrike Fischer, Loren Davis and Udi Fogiel.

There are also many contributors for specific languages, which are mentioned in the respective files. Without them, babel just wouldn't exist.
