The babel package is being developed incrementally, which means parts of the code are under development and therefore incomplete. Only documented features are considered complete. In other words, use babel in real documents only as documented (except, of course, if you want to explore and test them).

1 Identification and loading of required files

Code documentation is still under revision.

The babel package after unpacking consists of the following files:

babel.sty is the L^AT_EX package, which set options and load language styles.

babel.def is loaded by Plain.

switch.def defines macros to set and switch languages (it loads part babel.def).

plain.def is not used, and just loads babel.def, for compatibility.

hyphen.cfg is the file to be used when generating the formats to load hyphenation patterns.

There some additional tex, def and lua files

The babel installer extends docstrip with a few “pseudo-guards” to set “variables” used at installation time. They are used with <@name> at the appropriated places in the source code and defined with either <<name=value>>, or with a series of lines between <<*name>> and <</name>>. The latter is cumulative (eg, with *More package options*). That brings a little bit of literate programming. The guards <-name> and <+name> have been redefined, too. See babel.ins for further details.

2 locale directory

A required component of babel is a set of ini files with basic definitions for about 250 languages. They are distributed as a separate zip file, not packed as dtx. Most of them are essentially finished (except bugs and mistakes, of course). Some of them are still incomplete (but they will be usable), and there are some omissions (eg, there are no geographic areas in Spanish). Not all include LICR variants.

babel-*.ini files contain the actual data; babel-*.tex files are basically proxies to the corresponding ini files.

See [Keys in ini files](#) in the the babel site.

3 Tools

```
1 <<version=3.93.24475>>
2 <<date=2023/09/01>>
```

Do not use the following macros in ldf files. They may change in the future. This applies mainly to those recently added for replacing, trimming and looping. The older ones, like \bbl@afterfi, will not change.

We define some basic macros which just make the code cleaner. \bbl@add is now used internally instead of \addto because of the unpredictable behavior of the latter. Used in babel.def and in babel.sty, which means in L^AT_EX is executed twice, but we need them when defining options and babel.def cannot be load until options have been defined. This does not hurt, but should be fixed somehow.

```
3 <<*Basic macros>> ≡
4 \bbl@trace{Basic macros}
5 \def\bbl@stripslash{\expandafter\@gobble\string}
6 \def\bbl@add#1#2{%
7   \bbl@ifunset{\bbl@stripslash#1}%
8     {\def#1#2}%
9     {\expandafter\def\expandafter#1\expandafter{#1#2}}}
10 \def\bbl@xin@{\@expandtwoargs\in@}
11 \def\bbl@carg#1#2{\expandafter#1\csname#2\endcsname}%
12 \def\bbl@ncarg#1#2#3{\expandafter#1\expandafter#2\csname#3\endcsname}%
13 \def\bbl@ccarg#1#2#3{%
14   \expandafter#1\csname#2\expandafter\endcsname\csname#3\endcsname}%
15 \def\bbl@csarg#1#2{\expandafter#1\csname bbl@#2\endcsname}%
16 \def\bbl@cs#1{\csname bbl@#1\endcsname}
17 \def\bbl@c#1{\csname bbl@#1\language\endcsname}
```

```

18 \def\bbl@loop#1#2#3{\bbl@loop#1{#3}#2,\@nnil,}
19 \def\bbl@loopx#1#2{\expandafter\bbl@loop\expandafter#1\expandafter{#2}}
20 \def\bbl@loop#1#2#3,{%
21   \ifx\@nnil#3\relax\else
22     \def#1{#3}#2\bbl@afterfi\bbl@loop#1{#2}%
23   \fi}
24 \def\bbl@for#1#2#3{\bbl@loopx#1{#2}{\ifx#1\@empty\else#3\fi}}

```

`\bbl@add@list` This internal macro adds its second argument to a comma separated list in its first argument. When the list is not defined yet (or empty), it will be initiated. It presumes expandable character strings.

```

25 \def\bbl@add@list#1#2{%
26   \edef#1{%
27     \bbl@ifunset{\bbl@stripslash#1}%
28     {}%
29     {\ifx#1\@empty\else#1,\fi}%
30     #2}}

```

`\bbl@afterelse` Because the code that is used in the handling of active characters may need to look ahead, we take extra care to ‘throw’ it over the `\else` and `\fi` parts of an `\if`-statement¹. These macros will break if another `\if... \fi` statement appears in one of the arguments and it is not enclosed in braces.

```

31 \long\def\bbl@afterelse#1\else#2\fi{\fi#1}
32 \long\def\bbl@afterfi#1\fi{\fi#1}

```

`\bbl@exp` Now, just syntactical sugar, but it makes partial expansion of some code a lot more simple and readable. Here `\` stands for `\noexpand`, `\<.>` for `\noexpand` applied to a built macro name (which does not define the macro if undefined to `\relax`, because it is created locally), and `\[. .]` for one-level expansion (where `. .` is the macro name without the backslash). The result may be followed by extra arguments, if necessary.

```

33 \def\bbl@exp#1{%
34   \begingroup
35   \let\<\noexpand
36   \let\<\bbl@exp@en
37   \let\[\bbl@exp@ue
38   \edef\bbl@exp@aux{\endgroup#1}%
39   \bbl@exp@aux}
40 \def\bbl@exp@en#1>{\expandafter\noexpand\csname#1\endcsname}%
41 \def\bbl@exp@ue#1]{%
42   \unexpanded\expandafter\expandafter\expandafter{\csname#1\endcsname}}%

```

`\bbl@trim` The following piece of code is stolen (with some changes) from `keyval`, by David Carlisle. It defines two macros: `\bbl@trim` and `\bbl@trim@def`. The first one strips the leading and trailing spaces from the second argument and then applies the first argument (a macro, `\toks@` and the like). The second one, as its name suggests, defines the first argument as the stripped second argument.

```

43 \def\bbl@tempa#1{%
44   \long\def\bbl@trim##1##2{%
45     \futurelet\bbl@trim@a\bbl@trim@c##2\@nil\@nil#1\@nil\relax{##1}}%
46   \def\bbl@trim@c{%
47     \ifx\bbl@trim@a\@sptoken
48       \expandafter\bbl@trim@b
49     \else
50       \expandafter\bbl@trim@b\expandafter#1%
51     \fi}%
52   \long\def\bbl@trim@b#1##1 \@nil{\bbl@trim@i##1}}
53 \bbl@tempa{ }
54 \long\def\bbl@trim@i#1\@nil#2\relax#3{#3{#1}}
55 \long\def\bbl@trim@def#1{\bbl@trim{def#1}}

```

`\bbl@ifunset` To check if a macro is defined, we create a new macro, which does the same as `\@ifundefined`. However, in an ϵ -tex engine, it is based on `\ifcsname`, which is more efficient, and does not waste

¹This code is based on code presented in TUGboat vol. 12, no2, June 1991 in “An expansion Power Lemma” by Sonja Maus.

memory. Defined inside a group, to avoid `\ifcsname` being implicitly set to `\relax` by the `\csname` test.

```

56 \beginingroup
57   \gdef\bb@ifunset#1{%
58     \expandafter\ifx\csname#1\endcsname\relax
59       \expandafter\@firstoftwo
60     \else
61       \expandafter\@secondoftwo
62     \fi}
63 \bb@ifunset{ifcsname}%
64 {}%
65 {\gdef\bb@ifunset#1{%
66   \ifcsname#1\endcsname
67     \expandafter\ifx\csname#1\endcsname\relax
68       \bb@afterelse\expandafter\@firstoftwo
69     \else
70       \bb@afterfi\expandafter\@secondoftwo
71     \fi
72   \else
73     \expandafter\@firstoftwo
74   \fi}}
75 \endgroup

```

`\bb@ifblank` A tool from url, by Donald Arseneau, which tests if a string is empty or space. The companion macros tests if a macro is defined with some ‘real’ value, ie, not `\relax` and not empty,

```

76 \def\bb@ifblank#1{%
77   \bb@ifblank@i#1\@nil\@nil\@secondoftwo\@firstoftwo\@nil}
78 \long\def\bb@ifblank@i#1#2\@nil#3#4#5\@nil#4}
79 \def\bb@ifset#1#2#3{%
80   \bb@ifunset{#1}{#3}{\bb@exp{\bb@ifblank{\@nameuse{#1}}}{#3}{#2}}}

```

For each element in the comma separated `<key>=<value>` list, execute `<code>` with #1 and #2 as the key and the value of current item (trimmed). In addition, the item is passed verbatim as #3. With the `<key>` alone, it passes `\@empty` (ie, the macro thus named, not an empty argument, which is what you get with `<key>=` and no value).

```

81 \def\bb@forkv#1#2{%
82   \def\bb@kvcmd##1##2##3{#2}%
83   \bb@kvnext#1,\@nil,}
84 \def\bb@kvnext#1,{%
85   \ifx\@nil#1\relax\else
86     \bb@ifblank{#1}{\bb@forkv@eq#1=\@empty=\@nil{#1}}%
87     \expandafter\bb@kvnext
88   \fi}
89 \def\bb@forkv@eq#1=#2=#3\@nil#4{%
90   \bb@trim\def\bb@forkv@a{#1}%
91   \bb@trim{\expandafter\bb@kvcmd\expandafter{\bb@forkv@a}}{#2}{#4}}

```

A *for* loop. Each item (trimmed), is #1. It cannot be nested (it’s doable, but we don’t need it).

```

92 \def\bb@vforeach#1#2{%
93   \def\bb@forcmd##1{#2}%
94   \bb@fornext#1,\@nil,}
95 \def\bb@fornext#1,{%
96   \ifx\@nil#1\relax\else
97     \bb@ifblank{#1}{\bb@trim\bb@forcmd{#1}}%
98     \expandafter\bb@fornext
99   \fi}
100 \def\bb@foreach#1{\expandafter\bb@vforeach\expandafter{#1}}

```

`\bb@replace` Returns implicitly `\toks@` with the modified string.

```

101 \def\bb@replace#1#2#3{% in #1 -> repl #2 by #3
102   \toks@{}}
103 \def\bb@replace@aux##1#2##2#2{%

```

```

104 \ifx\bbl@nil##2%
105 \toks@{\expandafter{\the\toks@##1}%
106 \else
107 \toks@{\expandafter{\the\toks@##1#3}%
108 \bbl@afterfi
109 \bbl@replace@aux##2#2%
110 \fi}%
111 \expandafter\bbl@replace@aux#1#2\bbl@nil#2%
112 \edef#1{\the\toks@}}

```

An extension to the previous macro. It takes into account the parameters, and it is string based (ie, if you replace elax by ho, then \relax becomes \rho). No checking is done at all, because it is not a general purpose macro, and it is used by babel only when it works (an example where it does *not* work is in \bbl@TG@@date, and also fails if there are macros with spaces, because they are retokenized). It may change! (or even merged with \bbl@replace; I'm not sure ckecking the replacement is really necessary or just paranoia).

```

113 \ifx\detokenize\undefined\else % Unused macros if old Plain TeX
114 \bbl@exp{\def\\bbl@parsedef##1\detokenize{macro:}}#2->#3\relax{%
115 \def\bbl@tempa{#1}%
116 \def\bbl@tempb{#2}%
117 \def\bbl@tempe{#3}}
118 \def\bbl@sreplace#1#2#3{%
119 \begingroup
120 \expandafter\bbl@parsedef\meaning#1\relax
121 \def\bbl@tempc{#2}%
122 \edef\bbl@tempc{\expandafter\strip@prefix\meaning\bbl@tempc}%
123 \def\bbl@tempd{#3}%
124 \edef\bbl@tempd{\expandafter\strip@prefix\meaning\bbl@tempd}%
125 \bbl@xin@{\bbl@tempc}{\bbl@tempe}% If not in macro, do nothing
126 \ifin@
127 \bbl@exp{\\bbl@replace\\bbl@tempe{\bbl@tempc}{\bbl@tempd}}%
128 \def\bbl@tempc{% Expanded an executed below as 'uplevel'
129 \\makeatletter % "internal" macros with @ are assumed
130 \\scantokens{%
131 \bbl@tempa\\@namedef{\bbl@stripslash#1}\bbl@tempb{\bbl@tempe}}%
132 \catcode64=\the\catcode64\relax}% Restore @
133 \else
134 \let\bbl@tempc\empty % Not \relax
135 \fi
136 \bbl@exp{% For the 'uplevel' assignments
137 \endgroup
138 \bbl@tempc}} % empty or expand to set #1 with changes
139 \fi

```

Two further tools. \bbl@ifsamestring first expand its arguments and then compare their expansion (sanitized, so that the catcodes do not matter). \bbl@engine takes the following values: 0 is pdfTeX, 1 is luatex, and 2 is xetex. You may use the latter it in your language style if you want.

```

140 \def\bbl@ifsamestring#1#2{%
141 \begingroup
142 \protected@edef\bbl@tempb{#1}%
143 \edef\bbl@tempb{\expandafter\strip@prefix\meaning\bbl@tempb}%

145 \edef\bbl@tempc{\expandafter\strip@prefix\meaning\bbl@tempc}%
146 \ifx\bbl@tempb\bbl@tempc
147 \aftergroup\@firstoftwo
148 \else
149 \aftergroup\@secondoftwo
150 \fi
151 \endgroup}
152 \chardef\bbl@engine=%
153 \ifx\directlua\undefined
154 \ifx\XeTeXinputencoding\undefined
155 \z@

```

```

156 \else
157 \tw@
158 \fi
159 \else
160 \@ne
161 \fi

```

A somewhat hackish tool (hence its name) to avoid spurious spaces in some contexts.

```

162 \def\bbl@bsphack{%
163 \ifhmode
164 \hskip\z@skip
165 \def\bbl@esphack{\loop\ifdim\lastskip>\z@\unskip\repeat\unskip}%
166 \else
167 \let\bbl@esphack\@empty
168 \fi}

```

Another hackish tool, to apply case changes inside a protected macros. It's based on the internal `\let's` made by `\MakeUppercase` and `\MakeLowercase` between things like `\oe` and `\OE`.

```

169 \def\bbl@cased{%
170 \ifx\oe\OE
171 \expandafter\in@\expandafter
172 {\expandafter\OE\expandafter}\expandafter{\oe}%
173 \ifin@
174 \bbl@afterelse\expandafter\MakeUppercase
175 \else
176 \bbl@afterfi\expandafter\MakeLowercase
177 \fi
178 \else
179 \expandafter\@firstofone
180 \fi}

```

The following adds some code to `\extras...` both before and after, while avoiding doing it twice. It's somewhat convoluted, to deal with `#s`. Used to deal with `alph`, `Alph` and `frenchspacing` when there are already changes (with `\babel@save`).

```

181 \def\bbl@extras@wrap#1#2#3{% 1:in-test, 2:before, 3:after
182 \toks@\expandafter\expandafter\expandafter{%
183 \csname extras\language\endcsname}%
184 \bbl@exp{\in@{#1}}{\the\toks@}}%
185 \ifin@\else
186 \@temptokena{#2}%
187 \edef\bbl@tempc{\the\@temptokena\the\toks@}%
188 \toks@\expandafter{\bbl@tempc#3}%
189 \expandafter\edef\csname extras\language\endcsname{\the\toks@}%
190 \fi}
191 <</Basic macros>>

```

Some files identify themselves with a \TeX macro. The following code is placed before them to define (and then undefine) if not in \TeX .

```

192 <<(*Make sure ProvidesFile is defined)>> \equiv
193 \ifx\ProvidesFile\@undefined
194 \def\ProvidesFile#1[#2 #3 #4]{%
195 \wlog{File: #1 #4 #3 <#2>}%
196 \let\ProvidesFile\@undefined}
197 \fi
198 <</Make sure ProvidesFile is defined>>

```

3.1 Multiple languages

`\language` Plain \TeX version 3.0 provides the primitive `\language` that is used to store the current language. When used with a pre-3.0 version this function has to be implemented by allocating a counter. The following block is used in `switch.def` and `hyphen.cfg`; the latter may seem redundant, but remember `babel` doesn't require loading `switch.def` in the format.

```

199 <<(*Define core switching macros)>> \equiv

```

```

200 \ifx\language\@undefined
201   \csname newcount\endcsname\language
202 \fi
203 <</Define core switching macros>>

```

`\last@language` Another counter is used to keep track of the allocated languages. \TeX and \LaTeX reserves for this purpose the count 19.

`\addlanguage` This macro was introduced for $\TeX < 2$. Preserved for compatibility.

```

204 <<*Define core switching macros>> ≡
205 \countdef\last@language=19
206 \def\addlanguage{\csname newlanguage\endcsname}
207 <</Define core switching macros>>

```

Now we make sure all required files are loaded. When the command `\AtBeginDocument` doesn't exist we assume that we are dealing with a plain-based format. In that case the file `plain.def` is needed (which also defines `\AtBeginDocument`, and therefore it is not loaded twice). We need the first part when the format is created, and `\orig@dump` is used as a flag. Otherwise, we need to use the second part, so `\orig@dump` is not defined (`plain.def` undefines it). Check if the current version of `switch.def` has been previously loaded (mainly, `hyphen.cfg`). If not, load it now. We cannot load `babel.def` here because we first need to declare and process the package options.

3.2 The Package File (\LaTeX , `babel.sty`)

```

208 <*package>
209 \NeedsTeXFormat{LaTeX2e}[2005/12/01]
210 \ProvidesPackage{babel}[<<date>> v<<version>> The Babel package]

```

Start with some “private” debugging tool, and then define macros for errors.

```

211 \@ifpackagewith{babel}{debug}
212   {\providecommand\bbbl@trace[1]{\message{^^J[ #1 ]}}%
213    \let\bbbl@debug\@firstofone
214    \ifx\directlua\@undefined\else
215      \directlua{ Babel = Babel or {}
216        Babel.debug = true }%
217      \input{babel-debug.tex}%
218    \fi}
219 {\providecommand\bbbl@trace[1]{}%
220  \let\bbbl@debug@gobble
221  \ifx\directlua\@undefined\else
222    \directlua{ Babel = Babel or {}
223      Babel.debug = false }%
224  \fi}
225 \def\bbbl@error#1#2{%
226   \begingroup
227     \def\{\MessageBreak}%
228     \PackageError{babel}{#1}{#2}%
229   \endgroup}
230 \def\bbbl@warning#1{%
231   \begingroup
232     \def\{\MessageBreak}%
233     \PackageWarning{babel}{#1}%
234   \endgroup}
235 \def\bbbl@infowarn#1{%
236   \begingroup
237     \def\{\MessageBreak}%
238     \PackageNote{babel}{#1}%
239   \endgroup}
240 \def\bbbl@info#1{%
241   \begingroup
242     \def\{\MessageBreak}%
243     \PackageInfo{babel}{#1}%
244   \endgroup}

```

This file also takes care of a number of compatibility issues with other packages and defines a few additional package options. Apart from all the language options below we also have a few options that influence the behavior of language definition files.

Many of the following options don't do anything themselves, they are just defined in order to make it possible for babel and language definition files to check if one of them was specified by the user.

But first, include here the *Basic macros* defined above.

```

245 <<Basic macros>>
246 \ifpackagewith{babel}{silent}
247   {\let\bbl@info@gobble
248    \let\bbl@infowarn@gobble
249    \let\bbl@warning@gobble}
250 {}
251 %
252 \def\AfterBabelLanguage#1{%
253   \global\expandafter\bbl@add\csname#1.1df-h@k\endcsname}%

```

If the format created a list of loaded languages (in \bbl@languages), get the name of the 0-th to show the actual language used. Also available with base, because it just shows info.

```

254 \ifx\bbl@languages\undefined\else
255   \begingroup
256     \catcode`\^^I=12
257     \ifpackagewith{babel}{showlanguages}{%
258       \begingroup
259         \def\bbl@elt#1#2#3#4{\wlog{#2^^I#1^^I#3^^I#4}}%
260         \wlog{<*languages>}%
261         \bbl@languages
262         \wlog{</languages>}%
263       \endgroup}{%
264     \endgroup
265     \def\bbl@elt#1#2#3#4{%
266       \ifnum#2=\z@

```

3.3 base

The first 'real' option to be processed is base, which set the hyphenation patterns then resets `ver@babel.sty` so that \TeX forgets about the first loading. After a subset of `babel.def` has been loaded (the old `switch.def`) and `\AfterBabelLanguage` defined, it exits.

Now the base option. With it we can define (and load, with `luatex`) hyphenation patterns, even if we are not interested in the rest of babel.

```

272 \bbl@trace{Defining option 'base'}
273 \ifpackagewith{babel}{base}{%
274   \let\bbl@onlyswitch\empty

291   \endinput}{%

```

3.4 key=value options and other general option

The following macros extract language modifiers, and only real package options are kept in the option list. Modifiers are saved and assigned to `\BabelModifiers` at `\bbl@load@language`; when no modifiers have been given, the former is `\relax`. How modifiers are handled are left to language styles; they can use `\in@`, loop them with `\@for` or `load keyval`, for example.

```
292 \bbl@trace{key=value and another general options}
293 \bbl@csarg\let{tempa\expandafter}\csname opt@babel.sty\endcsname
294 \def\bbl@tempb#1.#2{% Remove trailing dot

333 \chardef\bbl@iniflag\z@
334 \DeclareOption{provide=*}{\chardef\bbl@iniflag\@ne} % main -> +1
335 \DeclareOption{provide+=*}{\chardef\bbl@iniflag\tw@} % add = 2
336 \DeclareOption{provide*=*}{\chardef\bbl@iniflag\thr@@} % add + main
337 % A separate option
338 \let\bbl@autoload@options\@empty
339 \DeclareOption{provide@=*}{\def\bbl@autoload@options{import}}
340 % Don't use. Experimental. TODO.
341 \newif\ifbbl@single
342 \DeclareOption{selectors=off}{\bbl@singletrue}
343 <<More package options>>
```

Handling of package options is done in three passes. (I [JBL] am not very happy with the idea,

anyway.) The first one processes options which has been declared above or follow the syntax `<key>=<value>`, the second one loads the requested languages, except the main one if set with the key main, and the third one loads the latter. First, we “flag” valid keys with a nil value.

```

344 \let\bbl@opt@shorthands\@nnil
345 \let\bbl@opt@config\@nnil
346 \let\bbl@opt@main\@nnil
347 \let\bbl@opt@headfoot\@nnil
348 \let\bbl@opt@layout\@nnil
349 \let\bbl@opt@provide\@nnil

```

The following tool is defined temporarily to store the values of options.

```

350 \def\bbl@tempa#1=#2\bbl@tempa{%
351   \bbl@csarg\ifx{opt@#1}\@nnil
352     \bbl@csarg\edef{opt@#1}{#2}%
353   \else
354     \bbl@error
355     {Bad option '#1=#2'. Either you have misspelled the\\%
356       key or there is a previous setting of '#1'. Valid\\%
357       keys are, among others, 'shorthands', 'main', 'bidi',\\%
358       'strings', 'config', 'headfoot', 'safe', 'math'.}%
359     {See the manual for further details.}
360   \fi}

```

Now the option list is processed, taking into account only currently declared options (including those declared with a =), and `<key>=<value>` options (the former take precedence). Unrecognized options are saved in `\bbl@language@opts`, because they are language options.

```

361 \let\bbl@language@opts\@empty
362 \DeclareOption*{%
363   \bbl@xin@{\string=}\CurrentOption}%
364   \ifin@
365     \expandafter\bbl@tempa\CurrentOption\bbl@tempa
366   \else
367     \bbl@add@list\bbl@language@opts{\CurrentOption}%
368   \fi}

```

Now we finish the first pass (and start over).

```

369 \ProcessOptions*
370 \ifx\bbl@opt@provide\@nnil
371   \let\bbl@opt@provide\@empty % %%% MOVE above
372 \else

378       \bbl@replace\bbl@opt@provide{;}{,}%
379     \fi}
380 \fi
381 %

```

3.5 Conditional loading of shorthands

If there is no `shorthands=<chars>`, the original babel macros are left untouched, but if there is, these macros are wrapped (in `babel.def`) to define only those given.

A bit of optimization: if there is no `shorthands=`, then `\bbl@ifshorthand` is always true, and it is always false if `shorthands` is empty. Also, some code makes sense only with `shorthands=...`

```

382 \bbl@trace{Conditional loading of shorthands}
383 \def\bbl@sh@string#1{%
384   \ifx#1\@empty\else
385     \ifx#1t\string~%
386     \else\ifx#1c\string,%
387     \else\string#1%

```

```

388 \fi\fi
389 \expandafter\bb@sh@string

438 \</package>
439 \<core>

```

3.6 Interlude for Plain

Because of the way docstrip works, we need to insert some code for Plain here. However, the tools provided by the babel installer for literate programming makes this section a short interlude, because the actual code is below, tagged as *Emulate LaTeX*.

```

440 \ifx\ldf@quit\undefined\else
441 \endinput\fi % Same line!
442 \<<Make sure ProvidesFile is defined>>
443 \ProvidesFile{babel.def}[\<<date>> v\<<version>> Babel common definitions]
444 \ifx\AtBeginDocument\undefined % TODO. change test.
445   \<<Emulate LaTeX>>
446 \fi
447 \<<Basic macros>>

```

That is all for the moment. Now follows some common stuff, for both Plain and \TeX . After it, we will resume the \TeX -only stuff.

```

448 \</core>
449 \<package | core>

```

4 Multiple languages

This is not a separate file (switch.def) anymore.

Plain \TeX version 3.0 provides the primitive `\language` that is used to store the current language. When used with a pre-3.0 version this function has to be implemented by allocating a counter.

```

450 \def\bbl@version{\<<version>>}
451 \def\bbl@date{\<<date>>}
452 \<<Define core switching macros>>

```

`\adddialect` The macro `\adddialect` can be used to add the name of a dialect or variant language, for which an already defined hyphenation table can be used.

```

453 \def\adddialect#1#2{%
454   \global\chardef#1#2\relax
455   \bbl@usehooks{adddialect}{\{#1\}\{#2\}}%
456   \begingroup

464         \def\bbl@elt####1####2####3####4{%
465           \fi}%
466         \bbl@cs{languages}%
467       \endgroup}

```

`\bbl@iflanguage` executes code only if the language `l@` exists. Otherwise raises an error.

The argument of `\bbl@fixname` has to be a macro name, as it may get “fixed” if casing (lc/uc) is wrong. It’s an attempt to fix a long-standing bug when `\foreignlanguage` and the like appear in a `\MakeXXXcase`. However, a lowercase form is not imposed to improve backward compatibility (perhaps you defined a language named MYLANG, but unfortunately mixed case names cannot be trapped). Note `l@` is encapsulated, so that its case does not change.

```

468 \def\bbl@fixname#1{%

560 (+core)

```

\iflanguage Users might want to test (in a private package for instance) which language is currently active. For this we provide a test macro, `\iflanguage`, that has three arguments. It checks whether the first argument is a known language. If so, it compares the first argument with the value of `\language`. Then, depending on the result of the comparison, it executes either the second or the third argument.

```

561 \def\iflanguage#1{%
562   \babel@iflanguage{#1}{%
563     \ifnum\csname l@#1\endcsname=\language
564       \expandafter\@firstoftwo
565     \else
566       \expandafter\@secondoftwo
567     \fi}}

```

4.1 Selecting the language

\selectlanguage The macro `\selectlanguage` checks whether the language is already defined before it performs its actual task, which is to update `\language` and activate language-specific definitions.

```

568 \let\babel@select@type\z@
569 \edef\selectlanguage{%
570   \noexpand\protect
571   \expandafter\noexpand\csname selectlanguage \endcsname}

```

Because the command `\selectlanguage` could be used in a moving argument it expands to `\protect\selectlanguage`. Therefore, we have to make sure that a macro `\protect` exists. If it doesn't it is `\let` to `\relax`.

```

572 \ifx\@undefined\protect\let\protect\relax\fi

```

The following definition is preserved for backwards compatibility (eg, arabi, koma). It is related to a trick for 2.09, now discarded.

```

573 \let\xstring\string

```

Since version 3.5 babel writes entries to the auxiliary files in order to typeset table of contents etc. in the correct language environment.

`\bbl@pop@language` But when the language change happens *inside* a group the end of the group doesn't write anything to the auxiliary files. Therefore we need TeX's `aftergroup` mechanism to help us. The command `\aftergroup` stores the token immediately following it to be executed when the current group is closed. So we define a temporary control sequence `\bbl@pop@language` to be executed at the end of the group. It calls `\bbl@set@language` with the name of the current language as its argument.

`\bbl@language@stack` The previous solution works for one level of nesting groups, but as soon as more levels are used it is no longer adequate. For that case we need to keep track of the nested languages using a stack mechanism. This stack is called `\bbl@language@stack` and initially empty.

```
574 \def\bbl@language@stack{}
```

When using a stack we need a mechanism to push an element on the stack and to retrieve the information afterwards.

`\bbl@push@language` The stack is simply a list of languagenames, separated with a '+' sign; the push function can be simple:

```
\bbl@pop@language
575 \def\bbl@push@language{%
576   \ifx\language\@undefined\else
577     \ifx\currentgrouplevel\@undefined
578       \xdef\bbl@language@stack{\language+\bbl@language@stack}%
579     \else
580       \ifnum\currentgrouplevel=\z@
581         \xdef\bbl@language@stack{\language+\bbl@language@stack}%
582       \else
583         \xdef\bbl@language@stack{\language+\bbl@language@stack}%
584       \fi
585     \fi
586   \fi}
```

Retrieving information from the stack is a little bit less simple, as we need to remove the element from the stack while storing it in the macro `\language`. For this we first define a helper function.

`\bbl@pop@lang` This macro stores its first element (which is delimited by the '+'-sign) in `\language` and stores the rest of the string in `\bbl@language@stack`.

```
587 \def\bbl@pop@lang#1+#2\@{%
588   \edef\language{#1}%
589   \xdef\bbl@language@stack{#2}}
```

The reason for the somewhat weird arrangement of arguments to the helper function is the fact it is called in the following way. This means that before `\bbl@pop@lang` is executed TeX first *expands* the stack, stored in `\bbl@language@stack`. The result of that is that the argument string of `\bbl@pop@lang` contains one or more language names, each followed by a '+'-sign (zero language names won't occur as this macro will only be called after something has been pushed on the stack).

```
590 \let\bbl@ifrestoring\@secondoftwo

595   \let\bbl@ifrestoring\@secondoftwo}
```

Once the name of the previous language is retrieved from the stack, it is fed to `\bbl@set@language` to do the actual work of switching everything that needs switching.

An alternative way to identify languages (in the babel sense) with a numerical value is introduced in 3.30. This is one of the first steps for a new interface based on the concept of locale, which explains the name of `\localeid`. This means `\l@. . .` will be reserved for hyphenation patterns (so that two locales can share the same rules).

```
596 \chardef\localeid\z@

```

`\bbl@set@language` The macro `\bbl@set@language` takes care of switching the language environment *and* of writing entries on the auxiliary files. For historical reasons, language names can be either language of `\language`. To catch either form a trick is used, but unfortunately as a side effect the catcodes of letters in `\language` are messed up. This is a bug, but preserved for backwards compatibility. The list of auxiliary files can be extended by redefining `\BabelContentsFiles`, but make sure they are loaded inside a group (as aux, toc, lof, and lot do) or the last language of the document will remain active afterwards.

We also write a command to change the current language in the auxiliary files.

`\bbl@savelastskip` is used to deal with skips before the write whatsit (as suggested by U Fischer). Adapted from hyperref, but it might fail, so I'll consider it a temporary hack, while I study other options (the ideal, but very likely unfeasible except perhaps in luatex, is to avoid the `\write` altogether when not needed).

```

First, check if the user asks for a known language. If so, update the value of `\language` and call `\originalTeX` to bring \TeX in a certain pre-defined state.

The name of the language is stored in the control sequence `\languagename`.

Then we have to *redefine* `\originalTeX` to compensate for the things that have been activated. To save memory space for the macro definition of `\originalTeX`, we construct the control sequence name for the `\noextras<lang>` command at definition time by expanding the `\curname` primitive. Now activate the language-specific definitions. This is done by constructing the names of three macros by concatenating three words with the argument of `\selectlanguage`, and calling these macros.

The switching of the values of `\lefthyphenmin` and `\righthyphenmin` is somewhat different. First we save their current values, then we check if `\<lang>hyphenmins` is defined. If it is not, we set default values (2 and 3), otherwise the values in `\<lang>hyphenmins` will be used.

No text is supposed to be added with switching captions and date, so we remove any spurious spaces with `\bbl@bsphack` and `\bbl@esphack`.

`otherlanguage (env.)` The `otherlanguage` environment can be used as an alternative to using the `\selectlanguage` declarative command. When you are typesetting a document which mixes left-to-right and right-to-left typesetting you have to use this environment in order to let things work as you expect them to.

The `\ignorespaces` command is necessary to hide the environment when it is entered in horizontal mode.

```

771 \long\def\otherlanguage#1{%
772 \def\bbl@selectorname{other}%
773 \ifnum\bbl@hymapsel=\@cclv\let\bbl@hymapsel\thr@\fi
774 \csname selectlanguage \endcsname{#1}%
775 \ignorespaces}

```

The `\endotherlanguage` part of the environment tries to hide itself when it is called in horizontal mode.

```

776 \long\def\endotherlanguage{%
777 \global\@ignoretrue\ignorespaces}

```

`otherlanguage* (env.)` The `otherlanguage` environment is meant to be used when a large part of text from a different language needs to be typeset, but without changing the translation of words such as ‘figure’. This environment makes use of `\foreign@language`.

```

778 \expandafter\def\csname otherlanguage*\endcsname{%
779 \@ifnextchar[\bbl@otherlanguage@s{\bbl@otherlanguage@s[]}}
780 \def\bbl@otherlanguage@s[#1]#2{%
781 \def\bbl@selectorname{other*}%
782 \ifnum\bbl@hymapsel=\@cclv\chardef\bbl@hymapsel4\relax\fi
783 \def\bbl@select@opts{#1}%
784 \foreign@language{#2}}

```

At the end of the environment we need to switch off the extra definitions. The grouping mechanism of the environment will take care of resetting the correct hyphenation rules and “extras”.

```

785 \expandafter\let\csname endotherlanguage*\endcsname\relax

```

`\foreignlanguage` The `\foreignlanguage` command is another substitute for the `\selectlanguage` command. This command takes two arguments, the first argument is the name of the language to use for typesetting the text specified in the second argument.

Unlike `\selectlanguage` this command doesn’t switch *everything*, it only switches the hyphenation rules and the extra definitions for the language specified. It does this within a group and assumes the `\extras<lang>` command doesn’t make any `\global` changes. The coding is very similar to part of `\selectlanguage`.

`\bbl@beforeforeign` is a trick to fix a bug in bidi texts. `\foreignlanguage` is supposed to be a ‘text’ command, and therefore it must emit a `\leavevmode`, but it does not, and therefore the indent is placed on the opposite margin. For backward compatibility, however, it is done only if a right-to-left script is requested; otherwise, it is no-op.

(3.11) `\foreignlanguage*` is a temporary, experimental macro for a few lines with a different script direction, while preserving the paragraph format (thank the braces around `\par`, things like `\hangindent` are not reset). Do not use it in production, because its semantics and its syntax may change (and very likely will, or even it could be removed altogether). Currently it enters in vmode and then selects the language (which in turn sets the paragraph direction).

(3.11) Also experimental are the hook `foreign` and `foreign*`. With them you can redefine `\BabelText` which by default does nothing. Its behavior is not well defined yet. So, use it in horizontal mode only if you do not want surprises.

In other words, at the beginning of a paragraph `\foreignlanguage` enters into hmode with the surrounding lang, and with `\foreignlanguage*` with the new lang.

```

898     \endgroup}
899 \fi

```

`\originalTeX` The macro `\originalTeX` should be known to \TeX at this moment. As it has to be expandable we `\let` it to `\@empty` instead of `\relax`.

```

900 \ifx\originalTeX\undefined\let\originalTeX\@empty\fi

```

Because this part of the code can be included in a format, we make sure that the macro which initializes the save mechanism, `\babel@beginsave`, is not considered to be undefined.

```

901 \ifx\babel@beginsave\undefined\let\babel@beginsave\relax\fi

```

A few macro names are reserved for future releases of babel, which will use the concept of ‘locale’:

```

902 \providecommand\setlocale{%
903   \bbl@error
904   {Not yet available}%
905   {Find an armchair, sit down and wait}}
906 \let\uselocale\setlocale
907 \let\locale\setlocale
908 \let\selectlocale\setlocale
909 \let\textlocale\setlocale
910 \let\textlanguage\setlocale
911 \let\languagetext\setlocale

```

4.2 Errors

`\@nolanerr` The babel package will signal an error when a documents tries to select a language that hasn’t been defined earlier. When a user selects a language for which no hyphenation patterns were loaded into the format he will be given a warning about that fact. We revert to the patterns for `\language=0` in that case. In most formats that will be (US)english, but it might also be empty.

`\@noopterr` When the package was loaded without options not everything will work as expected. An error message is issued in that case.

When the format knows about `\PackageError` it must be \LaTeX 2_ϵ , so we can safely use its error handling interface. Otherwise we’ll have to ‘keep it simple’.

Infos are not written to the console, but on the other hand many people think warnings are errors, so a further message type is defined: an important info which is sent to the console.

```

\addto It takes two arguments, a *<control sequence>* and T_EX-code to be added to the *<control sequence>*.

If the *<control sequence>* has not been defined before it is defined now. The control sequence could also expand to `\relax`, in which case a circular definition results. The net result is a stack overflow. Note there is an inconsistency, because the assignment in the last branch is global.

```

976 \def\addto#1#2{%
977   \ifx#1\undefined
978     \def#1{#2}%

984        \xdef#1{\the\toks@}}%
985     \fi
986   \fi}

```

The macro `\initiate@active@char` below takes all the necessary actions to make its argument a shorthand character. The real work is performed once for each character. But first we define a little tool.

```

987 \def\bbl@withactive#1#2{%
988   \beginingroup
989     \lccode`~=#2\relax
990     \lowercase{\endgroup#1~}}

```

`\bbl@redefine` To redefine a command, we save the old meaning of the macro. Then we redefine it to call the original macro with the ‘sanitized’ argument. The reason why we do it this way is that we don’t want to redefine the \TeX macros completely in case their definitions change (they have changed in the past). A macro named `\macro` will be saved new control sequences named `\org@macro`.

```

991 \def\bbl@redefine#1{%
992   \edef\bbl@tempa{\bbl@stripslash#1}%
993   \expandafter\let\csname org@\bbl@tempa\endcsname#1%
994   \expandafter\def\csname\bbl@tempa\endcsname}
995 \@onlypreamble\bbl@redefine

```

`\bbl@redefine@long` This version of `\babel@redefine` can be used to redefine `\long` commands such as `\ifthenelse`.

```

996 \def\bbl@redefine@long#1{%
997   \edef\bbl@tempa{\bbl@stripslash#1}%
998   \expandafter\let\csname org@\bbl@tempa\endcsname#1%
999   \long\expandafter\def\csname\bbl@tempa\endcsname}
1000 \@onlypreamble\bbl@redefine@long

```

`\bbl@redefineroobust` For commands that are redefined, but which *might* be robust we need a slightly more intelligent macro. A robust command `foo` is defined to expand to `\protect\foo_`. So it is necessary to check whether `\foo_` exists. The result is that the command that is being redefined is always robust afterwards. Therefore all we need to do now is define `\foo_`.

```

1001 \def\bbl@redefineroobust#1{%
1002   \edef\bbl@tempa{\bbl@stripslash#1}%
1003   \bbl@ifunset{\bbl@tempa\space}%

1005      \bbl@exp{\def\#1{\protect\<\bbl@tempa\space>}}}%
1006     {\bbl@exp{\let\<org@\bbl@tempa>\<\bbl@tempa\space>}}}%
1007   \@namedef{\bbl@tempa\space}{}
1008 \@onlypreamble\bbl@redefineroobust

```

4.3 Hooks

Admittedly, the current implementation is a somewhat simplistic and does very little to catch errors, but it is meant for developers, after all. `\bbl@usehooks` is the commands used by `babel` to execute hooks defined for an event.

```

1009 \bbl@trace{Hooks}
1010 \newcommand\AddBabelHook[3][[]]{%
1011   \bbl@ifunset{\bbl@hk@#2}{\EnableBabelHook{#2}}{}}%

```

```

1012 \def\bbl@tempa##1,#3=##2,##3\@empty{\def\bbl@tempb{##2}}%
1013 \expandafter\bbl@tempa\bbl@evargs,#3=,\@empty
1014 \bbl@ifunset{\bbl@ev@#2@#3@#1}%
1015 {\bbl@csarg\bbl@add{ev@#3@#1}{\bbl@elth{#2}}}%
1016 {\bbl@csarg\let{ev@#2@#3@#1}\relax}%
1017 \bbl@csarg\newcommand{ev@#2@#3@#1}{\bbl@tempb}}
1018 \newcommand\EnableBabelHook[1]{\bbl@csarg\let{hk@#1}\@firstofone}
1019 \newcommand\DisableBabelHook[1]{\bbl@csarg\let{hk@#1}\@gobble}
1020 \def\bbl@usehooks{\bbl@usehooks@lang\language}
1021 \def\bbl@usehooks@lang#1#2#3{% Test for Plain
1022 \ifx\UseHook\@undefined\else\UseHook{babel/*/#2}\fi
1023 \def\bbl@elth##1{%
1024 \bbl@cs{hk@##1}{\bbl@cs{ev@##1@#2@#3}}}%
1025 \bbl@cs{ev@#2@#3}%
1026 \ifx\language\@undefined\else % Test required for Plain (?)
1027 \ifx\UseHook\@undefined\else\UseHook{babel/#1/#2}\fi
1028 \def\bbl@elth##1{%
1029 \bbl@cs{hk@##1}{\bbl@cs{ev@##1@#2@#3}}}%
1030 \bbl@cs{ev@#2@#3}%
1031 \fi}

```

To ensure forward compatibility, arguments in hooks are set implicitly. So, if a further argument is added in the future, there is no need to change the existing code. Note events intended for hyphen.cfg are also loaded (just in case you need them for some reason).

```

1032 \def\bbl@evargs{,% <- don't delete this comma
1033 everylanguage=1,loadkernel=1,loadpatterns=1,loadexceptions=1,%
1034 adddialect=2,patterns=2,defaultcommands=0,encodedcommands=2,write=0,%

1039 \def\bbl@tempa#1=#2\@{\NewHook{babel/#1}}
1040 \bbl@foreach\bbl@evargs{\bbl@tempa#1\@}
1041 \fi

```

\babelensure The user command just parses the optional argument and creates a new macro named `\bbl@e@<language>`. We register a hook at the `afterextras` event which just executes this macro in a “complete” selection (which, if undefined, is `\relax` and does nothing). This part is somewhat involved because we have to make sure things are expanded the correct number of times. The macro `\bbl@e@<language>` contains `\bbl@ensure{(include)}{(exclude)}{(fontenc)}`, which in turn loops over the macros names in `\bbl@captionslist`, excluding (with the help of `\in@`) those in the exclude list. If the fontenc is given (and not `\relax`), the `\fontencoding` is also added. Then we loop over the include list, but if the macro already contains `\foreignlanguage`, nothing is done. Note this macro (1) is not restricted to the preamble, and (2) changes are local.

```

4.4 Setting up language files

\LdfInit \LdfInit macro takes two arguments. The first argument is the name of the language that will be defined in the language definition file; the second argument is either a control sequence or a string from which a control sequence should be constructed. The existence of the control sequence indicates that the file has been processed before.

At the start of processing a language definition file we always check the category code of the @-sign. We make sure that it is a 'letter' during the processing of the file. We also save its name as the last called option, even if not loaded.

Another character that needs to have the correct category code during processing of language definition files is the equals sign, '=', because it is sometimes used in constructions with the \let primitive. Therefore we store its current catcode and restore it later on.

Now we check whether we should perhaps stop the processing of this file. To do this we first need to check whether the second argument that is passed to \LdfInit is a control sequence. We do that by looking at the first token after passing #2 through string. When it is equal to \@backslashchar we are dealing with a control sequence which we can compare with \@undefined.

If so, we call \ldf@quit to set the main language, restore the category code of the @-sign and call

\endinput
When #2 was *not* a control sequence we construct one and compare it with \relax.
Finally we check \originalTeX.

```

4.5 Shorthands

`\bbl@add@special` The macro `\bbl@add@special` is used to add a new character (or single character control sequence) to the macro `\dospecials` (and `\@sanitize` if \TeX is used). It is used only at one place, namely

when `\initiate@active@char` is called (which is ignored if the char has been made active before). Because `\@sanitize` can be undefined, we put the definition inside a conditional. Items are added to the lists without checking its existence or the original catcode. It does not hurt, but should be fixed. It's already done with `\nfss@catcodes`, added in 3.10.

```

1201 \bbl@trace{Shorhands}
1202 \def\bbl@add@special#1{% 1:a macro like \", \?, etc.
1203   \bbl@add\dospecials{\do#1}% test @sanitize = \relax, for back. compat.
1204   \bbl@ifunset{@sanitize}{\bbl@add@sanitize{\@makeother#1}}%
1205   \ifx\nfss@catcodes\undefined\else % TODO - same for above
1206     \begingroup
1207       \catcode`#1\active
1208       \nfss@catcodes
1209       \ifnum\catcode`#1=\active
1210         \endgroup
1211         \bbl@add\nfss@catcodes{\@makeother#1}%
1212       \else
1213         \endgroup
1214       \fi
1215   \fi}

```

`\bbl@remove@special` The companion of the former macro is `\bbl@remove@special`. It removes a character from the set macros `\dospecials` and `\@sanitize`, but it is not used at all in the babel core.

```

1216 \def\bbl@remove@special#1{%
1217   \begingroup
1218     \def\x##1##2{\ifnum`#1=`##2\noexpand\@empty

1220     \def\do{\x\do}%
1221     \def\@makeother{\x\@makeother}%
1222   \edef\x{\endgroup
1223     \def\noexpand\dospecials{\dospecials}%
1224     \expandafter\ifx\csname @sanitize\endcsname\relax\else
1225       \def\noexpand\@sanitize{\@sanitize}%
1226     \fi}%
1227   \x}

```

`\initiate@active@char` A language definition file can call this macro to make a character active. This macro takes one argument, the character that is to be made active. When the character was already active this macro does nothing. Otherwise, this macro defines the control sequence `\normal@char<char>` to expand to the character in its ‘normal state’ and it defines the active character to expand to `\normal@char<char>` by default (`<char>` being the character to be made active). Later its definition can be changed to expand to `\active@char<char>` by calling `\bbl@activate{<char>}`. For example, to make the double quote character active one could have `\initiate@active@char{"}` in a language definition file. This defines `"` as `\active@prefix "\active@char` (where the first `"` is the character with its original catcode, when the shorthand is created, and `\active@char` is a single token). In protected contexts, it expands to `\protect "` or `\noexpand "` (ie, with the original `"`); otherwise `\active@char` is executed. This macro in turn expands to `\normal@char` in “safe” contexts (eg, `\label`), but `\user@active` in normal “unsafe” ones. The latter search a definition in the user, language and system levels, in this order, but if none is found, `\normal@char` is used. However, a deactivated shorthand (with `\bbl@deactivate` is defined as `\active@prefix "\normal@char`).

The following macro is used to define shorthands in the three levels. It takes 4 arguments: the (string’ed) character, `<level>@group`, `<level>@active` and `<next-level>@active` (except in system).

```

1228 \def\bbl@active@def#1#2#3#4{%
1229   \@namedef{#3#1}{%
1230     \expandafter\ifx\csname#2@sh#1\endcsname\relax
1231       \bbl@afterelse\bbl@sh@select#2#1{#3@arg#1}{#4#1}%
1232     \else
1233       \bbl@afterfi\csname#2@sh#1\endcsname
1234     \fi}%

```

When there is also no current-level shorthand with an argument we will check whether there is a next-level defined shorthand for this active character.

```

1235 \long\@namedef{#3@arg#1}##1{%
1236   \expandafter\ifx\csname#2@sh@#1@\string##1@\endcsname\relax
1237     \bbl@afterelse\csname#4#1\endcsname##1%
1238   \else
1239     \bbl@afterfi\csname#2@sh@#1@\string##1@\endcsname
1240   \fi}}%

```

`\initiate@active@char` calls `\@initiate@active@char` with 3 arguments. All of them are the same character with different catcodes: active, other (`\string'ed`) and the original one. This trick simplifies the code a lot.

```

1241 \def\initiate@active@char#1{%
1242   \bbl@ifunset{active@char\string#1}%
1243   {\bbl@withactive
1244     {\expandafter\@initiate@active@char\expandafter}#1\string#1#1}%
1245   {}}

```

The very first thing to do is saving the original catcode and the original definition, even if not active, which is possible (undefined characters require a special treatment to avoid making them `\relax` and preserving some degree of protection).

```

1246 \def\@initiate@active@char#1#2#3{%
1247   \bbl@csarg\edef{oricat@#2}{\catcode`#2=\the\catcode`#2\relax}%
1248   \ifx#1\@undefined
1249     \bbl@csarg\def{oridef@#2}{\def#1{\active@prefix#1\@undefined}}%
1250   \else
1251     \bbl@csarg\let{oridef@@#2}#1%
1252     \bbl@csarg\edef{oridef@#2}{%
1253       \let\noexpand#1%
1254       \expandafter\noexpand\csname bbl@oridef@@#2\endcsname}%
1255   \fi

```

If the character is already active we provide the default expansion under this shorthand mechanism. Otherwise we write a message in the transcript file, and define `\normal@char⟨char⟩` to expand to the character in its default state. If the character is mathematically active when babel is loaded (for example `'`) the normal expansion is somewhat different to avoid an infinite loop (but it does not prevent the loop if the mathcode is set to "8000 *a posteriori*").

```

1256 \ifx#1#3\relax
1257   \expandafter\let\csname normal@char#2\endcsname#3%
1258 \else
1259   \bbl@info{Making #2 an active character}%
1260   \ifnum\mathcode`#2=\ifodd\bbl@engine"1000000 \else"8000 \fi
1261     \@namedef{normal@char#2}{%
1262       \textormath{#3}{\csname bbl@oridef@@#2\endcsname}}%
1263   \else
1264     \@namedef{normal@char#2}{#3}%
1265   \fi

```

To prevent problems with the loading of other packages after babel we reset the catcode of the character to the original one at the end of the package and of each language file (except with `KeepShorthandsActive`). It is re-activate again at `\begin{document}`. We also need to make sure that the shorthands are active during the processing of the `.aux` file. Otherwise some citations may give unexpected results in the printout when a shorthand was used in the optional argument of `\bibitem` for example. Then we make it active (not strictly necessary, but done for backward compatibility).

```

1266 \bbl@restoreactive{#2}%
1267 \AtBeginDocument{%
1268   \catcode`#2\active
1269   \if@filesw
1270     \immediate\write\@mainaux{\catcode`\string#2\active}%
1271   \fi}%
1272 \expandafter\bbl@add@special\csname#2\endcsname
1273 \catcode`#2\active
1274 \fi

```

Now we have set `\normal@char⟨char⟩`, we must define `\active@char⟨char⟩`, to be executed when the character is activated. We define the first level expansion of `\active@char⟨char⟩` to check the

status of the `@safe@actives` flag. If it is set to true we expand to the ‘normal’ version of this character, otherwise we call `\user@active⟨char⟩` to start the search of a definition in the user, language and system levels (or eventually `normal@char⟨char⟩`).

```

1275 \let\bbl@tempa\@firstoftwo
1276 \if\string^#2%
1277   \def\bbl@tempa{\noexpand\textormath}%
1278 \else
1279   \ifx\bbl@mathnormal\@undefined\else
1280     \let\bbl@tempa\bbl@mathnormal
1281   \fi
1282 \fi
1283 \expandafter\edef\csname active@char#2\endcsname{%
1284   \bbl@tempa
1285     {\noexpand\if@safe@actives
1286       \noexpand\expandafter
1287       \expandafter\noexpand\csname normal@char#2\endcsname
1288     \noexpand\else
1289       \noexpand\expandafter
1290       \expandafter\noexpand\csname bbl@doactive#2\endcsname
1291     \noexpand\fi}%
1292   {\expandafter\noexpand\csname normal@char#2\endcsname}}%
1293 \bbl@csarg\edef{doactive#2}{%
1294   \expandafter\noexpand\csname user@active#2\endcsname}%

```

We now define the default values which the shorthand is set to when activated or deactivated. It is set to the deactivated form (globally), so that the character expands to

`\active@prefix⟨char⟩\normal@char⟨char⟩`

(where `\active@char⟨char⟩` is *one* control sequence!).

```

1295 \bbl@csarg\edef{active@#2}{%
1296   \noexpand\active@prefix\noexpand#1%
1297   \expandafter\noexpand\csname active@char#2\endcsname}%
1298 \bbl@csarg\edef{normal@#2}{%
1299   \noexpand\active@prefix\noexpand#1%
1300   \expandafter\noexpand\csname normal@char#2\endcsname}%
1301 \bbl@ncarg\let#1\bbl@normal@#2}%

```

The next level of the code checks whether a user has defined a shorthand for himself with this character. First we check for a single character shorthand. If that doesn’t exist we check for a shorthand with an argument.

```

1302 \bbl@active@def#2\user@group{user@active}{language@active}%
1303 \bbl@active@def#2\language@group{language@active}{system@active}%
1304 \bbl@active@def#2\system@group{system@active}{normal@char}%

```

In order to do the right thing when a shorthand with an argument is used by itself at the end of the line we provide a definition for the case of an empty argument. For that case we let the shorthand character expand to its non-active self. Also, When a shorthand combination such as ‘ ’ ends up in a heading \TeX would see `\protect'\protect'`. To prevent this from happening a couple of shorthand needs to be defined at user level.

```

1305 \expandafter\edef\csname\user@group @sh#2@@\endcsname
1306   {\expandafter\noexpand\csname normal@char#2\endcsname}%
1307 \expandafter\edef\csname\user@group @sh#2@\string\protect@\endcsname
1308   {\expandafter\noexpand\csname user@active#2\endcsname}%

```

Finally, a couple of special cases are taken care of. (1) If we are making the right quote (‘) active we need to change `\pr@m@s` as well. Also, make sure that a single ‘ in math mode ‘does the right thing’. (2) If we are using the caret (^) as a shorthand character special care should be taken to make sure math still works. Therefore an extra level of expansion is introduced with a check for math mode on the upper level.

```

1309 \if\string'#2%
1310   \let\prim@s\bbl@prim@s
1311   \let\active@math@prime#1%
1312 \fi
1313 \bbl@usehooks{initiateactive}{{#1}{#2}{#3}}

```

The following package options control the behavior of shorthands in math mode.

```

1314 <<{*More package options}>> ≡
1315 \DeclareOption{math=active}{}
1316 \DeclareOption{math=normal}{\def\bbl@mathnormal{\noexpand\textormath}}
1317 <</More package options>>

```

Initiating a shorthand makes active the char. That is not strictly necessary but it is still done for backward compatibility. So we need to restore the original catcode at the end of package *and* the end of the *ldf*.

```

1318 \@ifpackagewith{babel}{KeepShorthandsActive}%
1319   {\let\bbl@restoreactive@gobble}%
1320   {\def\bbl@restoreactive#1{%
1321     \bbl@exp{%
1322       \\\AfterBabelLanguage\\CurrentOption
1323       {\catcode`#1=\the\catcode`#1\relax}%
1324       \\\AtEndOfPackage
1325       {\catcode`#1=\the\catcode`#1\relax}}}%
1326   \AtEndOfPackage{\let\bbl@restoreactive@gobble}}

```

\bbl@sh@select This command helps the shorthand supporting macros to select how to proceed. Note that this macro needs to be expandable as do all the shorthand macros in order for them to work in expansion-only environments such as the argument of `\hyphenation`.

This macro expects the name of a group of shorthands in its first argument and a shorthand character in its second argument. It will expand to either `\bbl@firstcs` or `\bbl@scndcs`. Hence two more arguments need to follow it.

```

1327 \def\bbl@sh@select#1#2{%
1328   \expandafter\ifx\csname#1@sh@#2@sel\endcsname\relax
1329     \bbl@afterelse\bbl@scndcs
1330   \else
1331     \bbl@afterfi\csname#1@sh@#2@sel\endcsname
1332   \fi}

```

\active@prefix The command `\active@prefix` which is used in the expansion of active characters has a function similar to `\OT1-cmd` in that it `\protect`s the active character whenever `\protect` is *not* `\@typeset@protect`. The `\@gobble` is needed to remove a token such as `\activechar`: (when the double colon was the active character to be dealt with). There are two definitions, depending of `\ifincsn` is available. If there is, the expansion will be more robust.

```

1333 \begingroup
1334 \bbl@ifunset{ifincsn}% TODO. Ugly. Correct? Only Plain?
1335   {\gdef\active@prefix#1{%
1336     \ifx\protect\@typeset@protect

1359     \fi}}
1360 \endgroup

```

\if@safe@actives In some circumstances it is necessary to be able to reset the shorthand to its ‘normal’ value (usually the character with catcode ‘other’) on the fly. For this purpose the switch `@safe@actives` is available. The setting of this switch should be checked in the first level expansion of `\active@char⟨char⟩`. When this expansion mode is active (with `\@safe@activetrue`), something like “`”12”12` in an `\edef` (in other words, shorthands are `\string`’ed). This contrasts with `\protected@edef`, where catcodes are always left unchanged. Once converted, they can be used safely even after this expansion mode is deactivated (with `\@safe@activefalse`).

```

1361 \newif\if@safe@actives
1362 \@safe@activefalse

```

\bbl@restore@actives When the output routine kicks in while the active characters were made “safe” this must be undone in the headers to prevent unexpected typeset results. For this situation we define a command to make them “unsafe” again.

```

1363 \def\bbl@restore@actives{\if@safe@actives\@safe@activefalse\fi}

```

\bbl@activate Both macros take one argument, like `\initiate@active@char`. The macro is used to change the definition of an active character to expand to `\active@char⟨char⟩` in the case of `\bbl@activate`, or `\normal@char⟨char⟩` in the case of `\bbl@deactivate`.

```

1364 \chardef\bbl@activated\z@
1365 \def\bbl@activate#1{%
1366   \chardef\bbl@activated\@ne
1367   \bbl@withactive{\expandafter\let\expandafter}#1%
1368   \csname bbl@active@\string#1\endcsname}
1369 \def\bbl@deactivate#1{%
1370   \chardef\bbl@activated\tw@
1371   \bbl@withactive{\expandafter\let\expandafter}#1%
1372   \csname bbl@normal@\string#1\endcsname}

```

\bbl@firstcs These macros are used only as a trick when declaring shorthands.

```

\bbl@scndcs
1373 \def\bbl@firstcs#1#2{\csname#1\endcsname}
1374 \def\bbl@scndcs#1#2{\csname#2\endcsname}

```

\declare@shorthand The command `\declare@shorthand` is used to declare a shorthand on a certain level. It takes three arguments:

1. a name for the collection of shorthands, i.e. ‘system’, or ‘dutch’;
2. the character (sequence) that makes up the shorthand, i.e. `~` or `"a`;
3. the code to be executed when the shorthand is encountered.

The auxiliary macro `\babel@texpdf` improves the interoperativity with `hyperref` and takes 4 arguments: (1) The \TeX code in text mode, (2) the string for `hyperref`, (3) the \TeX code in math mode, and (4), which is currently ignored, but it’s meant for a string in math mode, like a minus sign instead of an hyphen (currently `hyperref` doesn’t discriminate the mode). This macro may be used in `ldf` files.

```

```

You may want to test if a character is a shorthand. Note it does not test whether the shorthand is on

or off.

```
1537 \newcommand\ifbabelshorthand[3]{\bbl@ifunset\bbl@active@string#1}{#3}{#2}}
```

`\bbl@prim@s` One of the internal macros that are involved in substituting `\prime` for each right quote in
`\bbl@pr@m@s` mathmode is `\prim@s`. This checks if the next character is a right quote. When the right quote is active, the definition of this macro needs to be adapted to look also for an active right quote; the hat could be active, too.

```
1538 \def\bbl@prim@s{%
1539   \prime\futurelet\@let@token\bbl@pr@m@s}
1540 \def\bbl@if@primes#1#2{%
1541   \ifx#1\@let@token

1545   \else
1546     \bbl@afterfi\expandafter\@secondoftwo
1547   \fi\fi}
1548 \begingroup
1549   \catcode`\^=7 \catcode`\*=active \lccode`\^=\^
1550   \catcode`\'=12 \catcode`\ "=active \lccode`\ "=\ '
1551   \lowercase{%
1552     \gdef\bbl@pr@m@s{%
1553       \bbl@if@primes" '%
1554       \pr@@@s
1555       {\bbl@if@primes*\pr@@@t\egroup}}
1556 \endgroup
```

Usually the `~` is active and expands to `\penalty\@M_{}`. When it is written to the `.aux` file it is written expanded. To prevent that and to be able to use the character `~` as a start character for a shorthand, it is redefined here as a one character shorthand on system level. The system declaration is in most cases redundant (when `~` is still a non-break space), and in some cases is inconvenient (if `~` has been redefined); however, for backward compatibility it is maintained (some existing documents may rely on the babel value).

```
1557 \initiate@active@char{~}
1558 \declare@shorthand{system}{~}{\leavevmode\nobreak\ }
1559 \bbl@activate{~}
```

`\OT1dqpos` The position of the double quote character is different for the OT1 and T1 encodings. It will later be
`\T1dqpos` selected using the `\f@encoding` macro. Therefore we define two macros here to store the position of the character in these encodings.

```
1560 \expandafter\def\csname OT1dqpos\endcsname{127}
1561 \expandafter\def\csname T1dqpos\endcsname{4}
```

When the macro `\f@encoding` is undefined (as it is in plain \TeX) we define it here to expand to OT1

```
1562 \ifx\f@encoding\undefined
1563   \def\f@encoding{OT1}
1564 \fi
```

4.6 Language attributes

Language attributes provide a means to give the user control over which features of the language definition files he wants to enable.

`\languageattribute` The macro `\languageattribute` checks whether its arguments are valid and then activates the selected language attribute. First check whether the language is known, and then process each attribute in the list.

```
1565 \bbl@trace{Language attributes}
1566 \newcommand\languageattribute[2]{%
1567   \def\bbl@tempc{#1}%
1568   \bbl@fixname\bbl@tempc
1569   \bbl@iflanguage\bbl@tempc{%
1570     \bbl@vforeach{#2}{%
```

We want to make sure that each attribute is selected only once; therefore we store the already selected attributes in `\bbl@known@attrs`. When that control sequence is not yet defined this attribute is certainly not selected before.

```

1571 \ifx\bbl@known@attrs\undefined
1572 \in@false
1573 \else
1574 \bbl@xin@{,\bbl@tempc-##1,}{,\bbl@known@attrs,}%
1575 \fi
1576 \ifin@
1577 \bbl@warning{%
1578     You have more than once selected the attribute '##1'\%
1579     for language #1. Reported}%
1580 \else

```

When we end up here the attribute is not selected before. So, we add it to the list of selected attributes and execute the associated \TeX -code.

```

1581 \bbl@exp{%
1582     \\bbl@add@list\\bbl@known@attrs{\bbl@tempc-##1}}%
1583 \edef\bbl@tempa{\bbl@tempc-##1}%
1584 \expandafter\bbl@ifknown@ttrib\expandafter{\bbl@tempa}\bbl@attributes%
1585 {\csname\bbl@tempc @attr@##1\endcsname}%
1586 {\@attrerr{\bbl@tempc}{##1}}%
1587 \fi}}
1588 \@onlypreamble\languageattribute

```

The error text to be issued when an unknown attribute is selected.

```

1589 \newcommand*{\@attrerr}[2]{%
1590 \bbl@error
1591 {The attribute #2 is unknown for language #1.}%
1592 {Your command will be ignored, type <return> to proceed}}

```

`\bbl@declare@attribute` This command adds the new language/attribute combination to the list of known attributes. Then it defines a control sequence to be executed when the attribute is used in a document. The result of this should be that the macro `\extras...` for the current language is extended, otherwise the attribute will not work as its code is removed from memory at `\begin{document}`.

```

1593 \def\bbl@declare@attribute#1#2#3{%
1594 \bbl@xin@{,#2,}{,\BabelModifiers,}%
1595 \ifin@
1596 \AfterBabelLanguage{#1}{\languageattribute{#1}{#2}}%
1597 \fi
1598 \bbl@add@list\bbl@attributes{#1-#2}%
1599 \expandafter\def\csname#1@attr@#2\endcsname{#3}}

```

`\bbl@ifattributeset` This internal macro has 4 arguments. It can be used to interpret \TeX code based on whether a certain attribute was set. This command should appear inside the argument to `\AtBeginDocument` because the attributes are set in the document preamble, *after* babel is loaded. The first argument is the language, the second argument the attribute being checked, and the third and fourth arguments are the true and false clauses.

```

1600 \def\bbl@ifattributeset#1#2#3#4{%
1601 \ifx\bbl@known@attrs\undefined
1602 \in@false
1603 \else
1604 \bbl@xin@{,#1-#2,}{,\bbl@known@attrs,}%
1605 \fi
1606 \ifin@
1607 \bbl@afterelse#3%
1608 \else
1609 \bbl@afterfi#4%
1610 \fi}

```

`\bbl@ifknown@ttrib` An internal macro to check whether a given language/attribute is known. The macro takes 4 arguments, the language/attribute, the attribute list, the \TeX -code to be executed when the attribute is known and the \TeX -code to be executed otherwise.

We first assume the attribute is unknown. Then we loop over the list of known attributes, trying to find a match.

```

1611 \def\bbl@ifknown@ttrib#1#2{%
1612   \let\bbl@tempa\@secondoftwo
1613   \bbl@loopx\bbl@tempb{#2}{%

1628 \AtBeginDocument{\bbl@clear@ttribs}

```

4.7 Support for saving macro definitions

To save the meaning of control sequences using `\babel@save`, we use temporary control sequences. To save hash table entries for these control sequences, we don't use the name of the control sequence to be saved to construct the temporary name. Instead we simply use the value of a counter, which is reset to zero each time we begin to save new values. This works well because we release the saved meanings before we begin to save a new set of control sequence meanings (see `\selectlanguage` and `\originalTeX`). Note undefined macros are not undefined any more when saved – they are `\relax`'ed.

`\babel@savecnt` The initialization of a new save cycle: reset the counter to zero.
`\babel@beginsave`

```

1629 \bbl@trace{Macros for saving definitions}
1630 \def\babel@beginsave{\babel@savecnt\z@}

```

Before it's forgotten, allocate the counter and initialize all.

```

1631 \newcount\babel@savecnt
1632 \babel@beginsave

```

`\babel@save` The macro `\babel@save{csname}` saves the current meaning of the control sequence `<csname>` to `\originalTeX`². To do this, we let the current meaning to a temporary control sequence, the restore commands are appended to `\originalTeX` and the counter is incremented. The macro `\babel@savevariable{variable}` saves the value of the variable. `<variable>` can be anything allowed after the `\the` primitive. To avoid messing saved definitions up, they are saved only the very first time.

```

1633 \def\babel@save#1{%
1634   \def\bbl@tempa{, #1,}% Clumsy, for Plain
1635   \expandafter\bbl@add\expandafter\bbl@tempa\expandafter{%

```

1645 \fi}
1646 \def\babel@savevariable#1{%
1647 \toks@\expandafter{\originalTeX #1}%
1648 \bbl@exp{\def\\originalTeX{\the\toks@\the#1\relax}}}

```

`\bbl@frenchspacing` Some languages need to have `\frenchspacing` in effect. Others don't want that. The command `\bbl@nonfrenchspacing` switches it on when it isn't already in effect and `\bbl@nonfrenchspacing` switches it off if necessary. A more refined way to switch the catcodes is done with ini files. Here an auxiliary macro is defined, but the main part is in `\babelprovide`. This new method should be ideally the default one.

```

1649 \def\bbl@frenchspacing{%

1694 \noexpand\newcommand

```

```

1695 \expandafter\noexpand\csname text##1\endcsname{%
1696 \noexpand\foreignlanguage{##2}}}%
1697 \bbl@tempc}%
1698 \bbl@for\bbl@tempa\bbl@tempa{%
1699 \expandafter\bbl@tempb\bbl@tempa\@@}}

```

4.9 Hyphens

`\babelhyphenation` This macro saves hyphenation exceptions. Two macros are used to store them: `\bbl@hyphenation@` for the global ones and `\bbl@hyphenation<lang>` for language ones. See `\bbl@patterns` above for further details. We make sure there is a space between words when multiple commands are used.

```

1700 \bbl@trace{Hyphens}
1701 \onlypreamble\babelhyphenation
1702 \AtEndOfPackage{%
1703 \newcommand\babelhyphenation[2][\@empty]{%
1704 \ifx\bbl@hyphenation@relax
1705 \let\bbl@hyphenation@\@empty
1706 \fi
1707 \ifx\bbl@hyphlist\@empty\else
1708 \bbl@warning{%
1709 You must not intermingle \string\selectlanguage\space and\\%
1710 \string\babelhyphenation\space or some exceptions will not\\%
1711 be taken into account. Reported}%
1712 \fi
1713 \ifx\@empty#1%
1714 \protected@edef\bbl@hyphenation@\bbl@hyphenation@\space#2}%
1715 \else
1716 \bbl@vforeach{#1}{%
1717 \def\bbl@tempa{##1}%
1718 \bbl@fixname\bbl@tempa
1719 \bbl@iflanguage\bbl@tempa{%
1720 \bbl@csarg\protected@edef{hyphenation@\bbl@tempa}{%
1721 \bbl@ifunset{bbl@hyphenation@\bbl@tempa}%
1722 {}%
1723 {\csname bbl@hyphenation@\bbl@tempa\endcsname\space}%
1724 #2}}}%
1725 \fi}}

```

`\bbl@allowhyphens` This macro makes hyphenation possible. Basically its definition is nothing more than `\nobreak \hskip 0pt plus 0pt`³.

```

1726 \def\bbl@allowhyphens{\ifvmode\else\nobreak\hskip\z@skip\fi}
1727 \def\bbl@t@one{T1}
1728 \def\allowhyphens{\ifx\cf@encoding\bbl@t@one\else\bbl@allowhyphens\fi}

```

`\babelhyphen` Macros to insert common hyphens. Note the space before `@` in `\babelhyphen`. Instead of protecting it with `\DeclareRobustCommand`, which could insert a `\relax`, we use the same procedure as shorthands, with `\active@prefix`.

```

1729 \newcommand\babelnullhyphen{\char\hyphenchar\font}
1730 \def\babelhyphen{\active@prefix\babelhyphen\bbl@hyphen}
1731 \def\bbl@hyphen{%
1732 \@ifstar{\bbl@hyphen@i @}{\bbl@hyphen@i\@empty}}
1733 \def\bbl@hyphen@i#1#2{%
1734 \bbl@ifunset{bbl@hy#1#2\@empty}%
1735 {\csname bbl@#1usehyphen\endcsname{\discretionary{#2}{}{#2}}}%
1736 {\csname bbl@hy#1#2\@empty\endcsname}}

```

The following two commands are used to wrap the “hyphen” and set the behavior of the rest of the word – the version with a single `@` is used when further hyphenation is allowed, while that with `@@` if no more hyphens are allowed. In both cases, if the hyphen is preceded by a positive space, breaking after the hyphen is disallowed.

³`\TeX` begins and ends a word for hyphenation at a glue node. The penalty prevents a linebreak at this glue node.

There should not be a discretionary after a hyphen at the beginning of a word, so it is prevented if preceded by a skip. Unfortunately, this does handle cases like “(-suffix)”. \nobreak is always preceded by \leavevmode, in case the shorthand starts a paragraph.

```
1737 \def\bbl@usehyphen#1{%
1738   \leavevmode
1739   \ifdim\lastskip>\z@\mbox{#1}\else\nobreak#1\fi
1740   \nobreak\hskip\z@skip}
1741 \def\bbl@usehyphen#1{%
1742   \leavevmode\ifdim\lastskip>\z@\mbox{#1}\else#1\fi}
```

The following macro inserts the hyphen char.

```
1743 \def\bbl@hyphenchar{%
1744   \ifnum\hyphenchar\font=\m@ne
1745     \babe\nullhyphen
1746   \else
1747     \char\hyphenchar\font
1748   \fi}
```

Finally, we define the hyphen “types”. Their names will not change, so you may use them in ldf’s. After a space, the \mbox in \bbl@hy@nobreak is redundant.

```
1749 \def\bbl@hy@soft{\bbl@usehyphen{\discretionary{\bbl@hyphenchar}{}}{}}
1750 \def\bbl@hy@@soft{\bbl@usehyphen{\discretionary{\bbl@hyphenchar}{}}{}}
1751 \def\bbl@hy@hard{\bbl@usehyphen\bbl@hyphenchar}
1752 \def\bbl@hy@@hard{\bbl@usehyphen\bbl@hyphenchar}
1753 \def\bbl@hy@nobreak{\bbl@usehyphen{\mbox{\bbl@hyphenchar}}{}}
1754 \def\bbl@hy@@nobreak{\mbox{\bbl@hyphenchar}}
1755 \def\bbl@hy@repeat{%
1756   \bbl@usehyphen{%
1757     \discretionary{\bbl@hyphenchar}{\bbl@hyphenchar}{\bbl@hyphenchar}}
1758 \def\bbl@hy@@repeat{%
1759   \bbl@usehyphen{%
1760     \discretionary{\bbl@hyphenchar}{\bbl@hyphenchar}{\bbl@hyphenchar}}
1761 \def\bbl@hy@empty{\hskip\z@skip}
1762 \def\bbl@hy@@empty{\discretionary{}{}{}}
```

\bbl@disc For some languages the macro \bbl@disc is used to ease the insertion of discretionaries for letters that behave ‘abnormally’ at a breakpoint.

```
1763 \def\bbl@disc#1#2{\nobreak\discretionary{#2- }{}{#1}\bbl@allowhyphens}
```

4.10 Multiencoding strings

The aim following commands is to provide a common interface for strings in several encodings. They also contains several hooks which can be used by luatex and xetex. The code is organized here with pseudo-guards, so we start with the basic commands.

Tools But first, a tool. It makes global a local variable. This is not the best solution, but it works.

```
1764 \bbl@trace{Multiencoding strings}
1765 \def\bbl@tglobal#1{\global\let#1#1}
```

The second one. We need to patch \@uclclist, but it is done once and only if \SetCase is used or if strings are encoded. The code is far from satisfactory for several reasons, including the fact \@uclclist is not a list any more. Therefore a package option is added to ignore it. Instead of gobbling the macro getting the next two elements (usually \reserved@a), we pass it as argument to \bbl@uclc. The parser is restarted inside \langle lang\rangle\bbl@uclc because we do not know how many expansions are necessary (depends on whether strings are encoded). The last part is tricky – when uppercasing, we have:

```
\let\bbl@tolower\@empty\bbl@toupper\@empty
```

and starts over (and similarly when lowercasing).

```
1766 \ifpackagewith{babel}{nocase}%
1767   {\let\bbl@patchuclc\relax}%
```

```

1768 {\def\bbbl@patchucllc{% TODO. Delete. Doesn't work any more.

Parse the encoding info to get the label, input, and font parts.

Select the behavior of \SetString. There are two main cases, depending of if there is an optional argument: without it and strings=encoded, strings are defined always; otherwise, they are set only if they are still undefined (ie, fallback values). With labelled blocks and strings=encoded, define the strings, but with another value, define strings only if the current label or font encoding is the value of strings; otherwise (ie, no strings or a block whose label is not in strings=) do nothing. We presume the current block is not loaded, and therefore set (above) a couple of default values to gobble the arguments. Then, these macros are redefined if necessary according to several parameters.

```

There are two versions of `\bbl@scswitch`. The first version is used when `\ldfs` are read, and it makes sure `\langle group \rangle \langle language \rangle` is reset, but only once (`\bbl@screset` is used to keep track of this). The second version is used in the preamble and packages loaded after `babel` and does nothing. The macro `\bbl@forlang` loops `\bbl@L` but its body is executed only if the value is in `\BabelLanguages` (inside `babel`) or `\date \langle language \rangle` is defined (after `babel` has been loaded). There are also two version of `\bbl@forlang`. The first one skips the current iteration if the language is not in `\BabelLanguages` (used in `\ldfs`), and the second one skips undefined languages (after `babel` has been loaded).

```

1888 \def\bbl@forlang#1#2{%
1889 \bbl@for#1\bbl@L{%

1911 \endgroup
1912 \bbl@scafter}
1913 \let\bbl@endcommands\EndBabelCommands

```

Now we define commands to be used inside `\StartBabelCommands`.

Strings The following macro is the actual definition of `\SetString` when it is “active”. First save the “switcher”. Create it if undefined. Strings are defined only if undefined (ie, like `\providescommand`). With the event `stringprocess` you can preprocess the string by manipulating the value of `\BabelString`. If there are several hooks assigned to this event, preprocessing is done in the same order as defined. Finally, the string is set.

```

1914 \def\bbl@setstring#1#2{% eg, \prefacename{<string>}
1915 \bbl@forlang\bbl@tempa{%
1916 \edef\bbl@LC{\bbl@tempa\bbl@stripslash#1}%
1917 \bbl@ifunset{\bbl@LC}% eg, \germanchaptername
1918 {\bbl@exp{%
1919 \global\\bbl@add\<\bbl@G\bbl@tempa>\\bbl@scset\\#1\<\bbl@LC>}}}%
1920 {}}%
1921 \def\BabelString{#2}%
1922 \bbl@usehooks{stringprocess}{}%

```

```

1923 \expandafter\bbL@stringdef
1924 \csname\bbL@LC\expandafter\endcsname\expandafter{\BabelString}}

```

Now, some additional stuff to be used when encoded strings are used. Captions then include `\bbL@encoded` for string to be expanded in case transformations. It is `\relax` by default, but in `\MakeUppercase` and `\MakeLowercase` its value is a modified expandable `\@changed@cmd`.

```

1925 \ifx\bbL@opt@strings\relax
1926 \def\bbL@scset#1#2{\def#1{\bbL@encoded#2}}
1927 \bbL@patchuclC
1928 \let\bbL@encoded\relax
1929 \def\bbL@encoded@uclC#1{%
1930 \inmathwarn#1%

1932 \expandafter\ifx\csname ?\string#1\endcsname\relax
1933 \TextSymbolUnavailable#1%
1934 \else
1935 \csname ?\string#1\endcsname
1936 \fi
1937 \else
1938 \csname\cf@encoding\string#1\endcsname
1939 \fi}
1940 \else
1941 \def\bbL@scset#1#2{\def#1{#2}}
1942 \fi

```

Define `\SetStringLoop`, which is actually set inside `\StartBabelCommands`. The current definition is somewhat complicated because we need a count, but `\count@` is not under our control (remember `\SetString` may call hooks). Instead of defining a dedicated count, we just “pre-expand” its value.

```

1943 <<*Macros local to BabelCommands>> ≡
1944 \def\SetStringLoop##1##2{%
1945 \def\bbL@templ####1{\expandafter\noexpand\csname##1\endcsname}%

4.11 Macros common to a number of languages

`\set@low@box` The following macro is used to lower quotes to the same level as the comma. It prepares its argument in box register 0.

```

2063 \bbl@trace{Macros related to glyphs}
2064 \def\set@low@box#1{\setbox\tw\hbox{,}\setbox\z@ \hbox{#1}%
2065     \dimen\z@ \ht\z@ \advance\dimen\z@ -\ht\tw@%
2066     \setbox\z@ \hbox{\lower\dimen\z@ \box\z@}\ht\z@ \ht\tw@ \dp\z@ \dp\tw@}

```

`\save@s f@q` The macro `\save@s f@q` is used to save and reset the current space factor.

```

2067 \def\save@s f@q#1{\leavevmode
2068     \begingroup
2069     \edef\@SF{\spacefactor\the\spacefactor}#1\@SF
2070     \endgroup}

```

4.12 Making glyphs available

This section makes a number of glyphs available that either do not exist in the OT1 encoding and have to be ‘faked’, or that are not accessible through `Tlenc.def`.

4.12.1 Quotation marks

`\quotedblbase` In the T1 encoding the opening double quote at the baseline is available as a separate character, accessible via `\quotedblbase`. In the OT1 encoding it is not available, therefore we make it available by lowering the normal open quote character to the baseline.

```
2071 \ProvideTextCommand{\quotedblbase}{OT1}{%
2072   \save@sf@q{\set@low@box{\textquotedblright\}}%
2073   \box\z@\kern-.04em\bbl@allowhyphens}}
```

Make sure that when an encoding other than OT1 or T1 is used this glyph can still be typeset.

```
2074 \ProvideTextCommandDefault{\quotedblbase}{%
2075   \UseTextSymbol{OT1}{\quotedblbase}}
```

`\quotesinglbase` We also need the single quote character at the baseline.

```
2076 \ProvideTextCommand{\quotesinglbase}{OT1}{%
2077   \save@sf@q{\set@low@box{\textquoteright\}}%
2078   \box\z@\kern-.04em\bbl@allowhyphens}}
```

Make sure that when an encoding other than OT1 or T1 is used this glyph can still be typeset.

```
2079 \ProvideTextCommandDefault{\quotesinglbase}{%
2080   \UseTextSymbol{OT1}{\quotesinglbase}}
```

`\guillemetleft` The guillemet characters are not available in OT1 encoding. They are faked. (Wrong names with o
`\guillemetright` preserved for compatibility.)

```
2081 \ProvideTextCommand{\guillemetleft}{OT1}{%
2082   \ifmmode
2083     \ll
2084   \else
2085     \save@sf@q{\nobreak
2086       \raise.2ex\hbox{$\scriptscriptstyle\ll$}\bbl@allowhyphens}%
2087     \fi}
2088 \ProvideTextCommand{\guillemetright}{OT1}{%
2089   \ifmmode
2090     \gg
2091   \else
2092     \save@sf@q{\nobreak
2093       \raise.2ex\hbox{$\scriptscriptstyle\gg$}\bbl@allowhyphens}%
2094     \fi}
2095 \ProvideTextCommand{\guillemotleft}{OT1}{%
2096   \ifmmode
2097     \ll
2098   \else
2099     \save@sf@q{\nobreak
2100       \raise.2ex\hbox{$\scriptscriptstyle\ll$}\bbl@allowhyphens}%
2101     \fi}
2102 \ProvideTextCommand{\guillemotright}{OT1}{%
2103   \ifmmode
2104     \gg
2105   \else
2106     \save@sf@q{\nobreak
2107       \raise.2ex\hbox{$\scriptscriptstyle\gg$}\bbl@allowhyphens}%
2108     \fi}
```

Make sure that when an encoding other than OT1 or T1 is used these glyphs can still be typeset.

```
2109 \ProvideTextCommandDefault{\guillemetleft}{%
2110   \UseTextSymbol{OT1}{\guillemetleft}}
2111 \ProvideTextCommandDefault{\guillemetright}{%
2112   \UseTextSymbol{OT1}{\guillemetright}}
2113 \ProvideTextCommandDefault{\guillemotleft}{%
2114   \UseTextSymbol{OT1}{\guillemotleft}}
2115 \ProvideTextCommandDefault{\guillemotright}{%
2116   \UseTextSymbol{OT1}{\guillemotright}}
```

```

\guilsinglleft The single guillemets are not available in OT1 encoding. They are faked.
\guilsinglright
2117 \ProvideTextCommand{\guilsinglleft}{OT1}{%
2118   \ifmmode
2119     <%
2120   \else
2121     \save@sf@q{\nobreak
2122       \raise.2ex\hbox{$\scriptscriptstyle<$}\bbl@allowhyphens}%
2123   \fi}
2124 \ProvideTextCommand{\guilsinglright}{OT1}{%
2125   \ifmmode
2126     >%
2127   \else
2128     \save@sf@q{\nobreak
2129       \raise.2ex\hbox{$\scriptscriptstyle>$}\bbl@allowhyphens}%
2130   \fi}

```

Make sure that when an encoding other than OT1 or T1 is used these glyphs can still be typeset.

```

2131 \ProvideTextCommandDefault{\guilsinglleft}{%
2132   \UseTextSymbol{OT1}{\guilsinglleft}}
2133 \ProvideTextCommandDefault{\guilsinglright}{%
2134   \UseTextSymbol{OT1}{\guilsinglright}}

```

4.12.2 Letters

\ij The dutch language uses the letter ‘ij’. It is available in T1 encoded fonts, but not in the OT1 encoded \IJ fonts. Therefore we fake it for the OT1 encoding.

```

2135 \DeclareTextCommand{\ij}{OT1}{%
2136   i\kern-0.02em\bbl@allowhyphens j}
2137 \DeclareTextCommand{\IJ}{OT1}{%
2138   I\kern-0.02em\bbl@allowhyphens J}
2139 \DeclareTextCommand{\ij}{T1}{\char188}
2140 \DeclareTextCommand{\IJ}{T1}{\char156}

```

Make sure that when an encoding other than OT1 or T1 is used these glyphs can still be typeset.

```

2141 \ProvideTextCommandDefault{\ij}{%
2142   \UseTextSymbol{OT1}{\ij}}
2143 \ProvideTextCommandDefault{\IJ}{%
2144   \UseTextSymbol{OT1}{\IJ}}

```

\dj The croatian language needs the letters \dj and \DJ; they are available in the T1 encoding, but not in \DJ the OT1 encoding by default.

Some code to construct these glyphs for the OT1 encoding was made available to me by Stipčević Mario, (stipcevic@olimp.irb.hr).

```

4.12.4 Umlauts and tremas

The command `\` needs to have a different effect for different languages. For German for instance, the ‘umlaut’ should be positioned lower than the default position for placing it over the letters a, o, u, A, O and U. When placed over an e, i, E or I it can retain its normal position. For Dutch the same glyph is always placed in the lower position.

`\umlauthigh` To be able to provide both positions of `\` we provide two commands to switch the positioning, the `\umlautlow` default will be `\umlauthigh` (the normal positioning).

```
2200 \def\umlauthigh{%
2201   \def\bbl@umlauta##1{\leavevmode\bgroup%
2202     \accent\csname\fontencoding dqpos\endcsname
2203     ##1\bbl@allowhyphens\egroup}%
2204   \let\bbl@umlaute\bbl@umlauta}
2205 \def\umlautlow{%
2206   \def\bbl@umlauta{\protect\lower@umlaut}}
2207 \def\umlautelower{%
2208   \def\bbl@umlaute{\protect\lower@umlaut}}
2209 \umlauthigh
```

`\lower@umlaut` The command `\lower@umlaut` is used to position the `\` closer to the letter. We want the umlaut character lowered, nearer to the letter. To do this we need an extra *(dimen)* register.

```
2210 \expandafter\ifx\csname U@D\endcsname\relax
2211   \csname newdimen\endcsname\U@D
2212 \fi
```

The following code fools \TeX 's `make_accent` procedure about the current x-height of the font to force another placement of the umlaut character. First we have to save the current x-height of the font, because we'll change this font dimension and this is always done globally.

Then we compute the new x-height in such a way that the umlaut character is lowered to the base character. The value of `.45ex` depends on the METAFONT parameters with which the fonts were built. (Just try out, which value will look best.) If the new x-height is too low, it is not changed. Finally we call the `\accent` primitive, reset the old x-height and insert the base character in the argument.

```
2213 \def\lower@umlaut#1{%
2214   \leavevmode\bgroup
2215   \U@D lex%
2216   {\setbox\z@\hbox{%
2217     \char\csname\fontencoding dqpos\endcsname}%
2218     \dimen@ -.45ex\advance\dimen@\ht\z@
2219     \ifdim lex<\dimen@ \fontdimen5\font\dimen@ \fi}%
2220   \accent\csname\fontencoding dqpos\endcsname
2221   \fontdimen5\font\U@D #1%
2222   \egroup}
```

For all vowels we declare `\` to be a composite command which uses `\bbl@umlauta` or `\bbl@umlaute` to position the umlaut character. We need to be sure that these definitions override the ones that are provided when the package `fontenc` with option `OT1` is used. Therefore these declarations are postponed until the beginning of the document. Note these definitions only apply to some languages, but `babel` sets them for *all* languages – you may want to redefine `\bbl@umlauta` and/or `\bbl@umlaute` for a language in the corresponding `ldf` (using the `babel` switching mechanism, of course).

```
2223 \AtBeginDocument{%
2224   \DeclareTextCompositeCommand{\}{OT1}{a}{\bbl@umlauta{a}}%
2225   \DeclareTextCompositeCommand{\}{OT1}{e}{\bbl@umlaute{e}}%

2231   \DeclareTextCompositeCommand{\}{OT1}{E}{\bbl@umlaute{E}}%
2232   \DeclareTextCompositeCommand{\}{OT1}{I}{\bbl@umlaute{I}}%
2233   \DeclareTextCompositeCommand{\}{OT1}{O}{\bbl@umlauta{O}}%
2234   \DeclareTextCompositeCommand{\}{OT1}{U}{\bbl@umlauta{U}}}
```

Finally, make sure the default hyphenrules are defined (even if empty). For internal use, another empty \language is defined. Currently used in Amharic.

```
2235 \ifx\l@english\@undefined
2236   \chardef\l@english\z@
2237 \fi
2238 % The following is used to cancel rules in ini files (see Amharic).

4.15 Creating and modifying languages

Continue with \LaTeX only.

`\babelprovide` is a general purpose tool for creating and modifying languages. It creates the language infrastructure, and loads, if requested, an ini file. It may be used in conjunction to previously loaded ldf files.

```

2300 </package | core>

Now, the ‘main loop’, which **must be executed inside a group**. At this point, \bbl@inidata may contain data declared in \babelprovide, with ‘slashed’ keys. There are 3 steps: first read the ini file and store it; then traverse the stored values, and process some groups if required (date, captions, labels, counters); finally, ‘export’ some values by defining global macros (identification, typography, characters, numbers). The second argument is 0 when called to read the minimal data for fonts; with \babelprovide it’s either 1 or 2.

```

```

A key with a slash in \babelprovide replaces the value in the ini file (which is ignored altogether). The mechanism is simple (but suboptimal): add the data to the ini one (at this point the ini file has not yet been read), and define a dummy macro. When the ini file is read, just skip the corresponding key and reset the macro (in \bbbl@inistore above).

```

```

Key-value pairs are treated differently depending on the section in the ini file. The following macros are the readers for identification and typography. Note \bbbl@ini@exports is called always (via \bbbl@inise), while \bbbl@after@ini must be called explicitly after \bbbl@read@ini if necessary. Although BCP 47 doesn't treat '-x-' as an extension, the CLDR and many other sources do (as a *private use extension*). For consistency with other single-letter subtags or 'singletons', here is considered an extension, too.

```

Dates will require some macros for the basic formatting. They may be redefined by language, so “semi-public” names (camel case) are used. Oddly enough, the CLDR places particles like “de” inconsistently in either in the date or in the month name. Note after `\bbl@replace\toks@` contains the resulting string, which is used by `\bbl@replace@finish@iii` (this implicit behavior doesn’t seem a good idea, but it’s efficient).

```

The code for additive counters is somewhat tricky and it's based on the fact the arguments just before @@ collects digits which have been left 'unused' in previous arguments, the first of them being the number of digits in the number to be converted. This explains the reverse set 76543210. Digits above 10000 are not handled yet. When the key contains the subkey .F., the number after is treated as an special case, for a fixed form (see babel-he.ini, for example).

5.1 Cross referencing macros

The \LaTeX book states:

The *key* argument is any sequence of letters, digits, and punctuation symbols; upper- and lowercase letters are regarded as different.

When the above quote should still be true when a document is typeset in a language that has active characters, special care has to be taken of the category codes of these characters when they appear in an argument of the cross referencing macros.

When a cross referencing command processes its argument, all tokens in this argument should be character tokens with category ‘letter’ or ‘other’.

The following package options control which macros are to be redefined.

```

3713 <<(*More package options)>> ≡
3714 \DeclareOption{safe=none}{\let\bbl@opt@safe\@empty}
3715 \DeclareOption{safe=bib}{\def\bbl@opt@safe{B}}
3716 \DeclareOption{safe=ref}{\def\bbl@opt@safe{R}}
3717 \DeclareOption{safe=refbib}{\def\bbl@opt@safe{BR}}
3718 \DeclareOption{safe=bibref}{\def\bbl@opt@safe{BR}}
3719 <</More package options>>

```

\@newl@bel First we open a new group to keep the changed setting of \protect local and then we set the @safe@actives switch to true to make sure that any shorthand that appears in any of the arguments immediately expands to its non-active self.

```

3720 \bbl@trace{Cross referencing macros}
3721 \ifx\bbl@opt@safe\@empty\else % ie, if 'ref' and/or 'bib'
3722   \def\@newl@bel#1#2#3{%
3723     {\@safe@activetrue
3724       \bbl@ifunset{#1#2}%
3725       \relax
3726       {\gdef\@multiplelabels{%
3727         \@latex@warning@no@line{There were multiply-defined labels}}%
3728         \@latex@warning@no@line{Label `#2' multiply defined}}%

```

```
3729 \global\@namedef{#1@#2}{#3}}
```

`\@testdef` An internal \TeX macro used to test if the labels that have been written on the .aux file have changed. It is called by the `\enddocument` macro.

```
3730 \CheckCommand*\@testdef[3]{%
3731   \def\reserved@a{#3}%
3732   \expandafter\ifx\csname#1@#2\endcsname\reserved@a
3733   \else
3734     \@tempswatrue
3735   \fi}
```

Now that we made sure that `\@testdef` still has the same definition we can rewrite it. First we make the shorthands ‘safe’. Then we use `\bbl@tempa` as an ‘alias’ for the macro that contains the label which is being checked. Then we define `\bbl@tempb` just as `\@newl@bel` does it. When the label is defined we replace the definition of `\bbl@tempa` by its meaning. If the label didn’t change, `\bbl@tempa` and `\bbl@tempb` should be identical macros.

```
3736 \def\@testdef#1#2#3{% TODO. With @samestring?
3737   \@safe@activetrue
3738   \expandafter\let\expandafter\bbl@tempa\csname #1@#2\endcsname
3739   \def\bbl@tempb{#3}%
3740   \@safe@activesfalse
3741   \ifx\bbl@tempa\relax
3742   \else
3743     \edef\bbl@tempa{\expandafter\strip@prefix\meaning\bbl@tempa}%
3744   \fi
3745   \edef\bbl@tempb{\expandafter\strip@prefix\meaning\bbl@tempb}%
3746   \ifx\bbl@tempa\bbl@tempb
3747   \else
3748     \@tempswatrue
3749   \fi}
3750 \fi
```

`\ref` The same holds for the macro `\ref` that references a label and `\pageref` to reference a page. We make them robust as well (if they weren’t already) to prevent problems if they should become expanded at the wrong moment.

```
3751 \bbl@xin@{R}\bbl@opt@safe
3752 \ifin@
3753   \edef\bbl@tempc{\expandafter\string\csname ref code\endcsname}%
3754   \bbl@xin@{\expandafter\strip@prefix\meaning\bbl@tempc}%
3755   {\expandafter\strip@prefix\meaning\ref}%
3756   \ifin@
3757     \bbl@redefine\@kernel@ref#1{%
3758       \@safe@activetrue\org@@kernel@ref{#1}\@safe@activesfalse}
3759     \bbl@redefine\@kernel@pageref#1{%
3760       \@safe@activetrue\org@@kernel@pageref{#1}\@safe@activesfalse}
3761     \bbl@redefine\@kernel@sref#1{%
3762       \@safe@activetrue\org@@kernel@sref{#1}\@safe@activesfalse}
3763     \bbl@redefine\@kernel@spageref#1{%
3764       \@safe@activetrue\org@@kernel@spageref{#1}\@safe@activesfalse}
3765   \else
3766     \bbl@redefinero bust\ref#1{%
3767       \@safe@activetrue\org@ref{#1}\@safe@activesfalse}
3768     \bbl@redefinero bust\pageref#1{%
3769       \@safe@activetrue\org@pageref{#1}\@safe@activesfalse}
3770   \fi
3771 \else
3772   \let\org@ref\ref
3773   \let\org@pageref\pageref
3774 \fi
```

`\@citex` The macro used to cite from a bibliography, `\cite`, uses an internal macro, `\@citex`. It is this internal macro that picks up the argument(s), so we redefine this internal macro and leave `\cite`

alone. The first argument is used for typesetting, so the shorthands need only be deactivated in the second argument.

```
3775 \bbl@xin@{B}\bbl@opt@safe
3776 \ifin@
3777 \bbl@redefine\@citex[#1]#2{%
3778   \@safe@activetrue\edef\@tempa{#2}\@safe@activesfalse
3779   \org@citex[#1]{\@tempa}}
```

Unfortunately, the packages natbib and cite need a different definition of \@citex... To begin with, natbib has a definition for \@citex with *three* arguments... We only know that a package is loaded when \begin{document} is executed, so we need to postpone the different redefinition.

```
3780 \AtBeginDocument{%
3781   \ifpackageloaded{natbib}{%
```

Notice that we use \def here instead of \bbl@redefine because \org@citex is already defined and we don't want to overwrite that definition (it would result in parameter stack overflow because of a circular definition).

(Recent versions of natbib change dynamically \@citex, so PR4087 doesn't seem fixable in a simple way. Just load natbib before.)

```
3782   \def\@citex[#1][#2]#3{%
3783     \@safe@activetrue\edef\@tempa{#3}\@safe@activesfalse
3784     \org@citex[#1][#2]{\@tempa}}%
3785   }{}}
```

The package cite has a definition of \@citex where the shorthands need to be turned off in both arguments.

```
3786 \AtBeginDocument{%
3787   \ifpackageloaded{cite}{%
3788     \def\@citex[#1]#2{%
3789       \@safe@activetrue\org@citex[#1][#2]\@safe@activesfalse}%
3790     }{}}
```

`\nocite` The macro \nocite which is used to instruct BiBTeX to extract uncited references from the database.

```
3791 \bbl@redefine\nocite#1{%
3792   \@safe@activetrue\org@nocite{#1}\@safe@activesfalse}
```

`\bibcite` The macro that is used in the .aux file to define citation labels. When packages such as natbib or cite are not loaded its second argument is used to typeset the citation label. In that case, this second argument can contain active characters but is used in an environment where \@safe@activetrue is in effect. This switch needs to be reset inside the \hbox which contains the citation label. In order to determine during .aux file processing which definition of \bibcite is needed we define \bibcite in such a way that it redefines itself with the proper definition. We call \bbl@cite@choice to select the proper definition for \bibcite. This new definition is then activated.

```
3793 \bbl@redefine\bibcite{%
3794   \bbl@cite@choice
3795   \bibcite}
```

`\bbl@bibcite` The macro \bbl@bibcite holds the definition of \bibcite needed when neither natbib nor cite is loaded.

```
3796 \def\bbl@bibcite#1#2{%
3797   \org@bibcite{#1}{\@safe@activesfalse#2}}
```

`\bbl@cite@choice` The macro \bbl@cite@choice determines which definition of \bibcite is needed. First we give \bibcite its default definition.

```
3798 \def\bbl@cite@choice{%
3799   \global\let\bibcite\bbl@bibcite
3800   \@ifpackageloaded{natbib}{\global\let\bibcite\org@bibcite}{}%
3801   \@ifpackageloaded{cite}{\global\let\bibcite\org@bibcite}{}%
3802   \global\let\bbl@cite@choice\relax}
```

When a document is run for the first time, no .aux file is available, and \bibcite will not yet be properly defined. In this case, this has to happen before the document starts.

```
3803 \AtBeginDocument{\bbl@cite@choice}
```

`\@bibitem` One of the two internal \TeX macros called by `\bibitem` that write the citation label on the .aux file.

```

3804 \bbl@redefine\@bibitem#1{%
3805   \@safe@activetrue\org@bibitem{#1}\@safe@activesfalse}
3806 \else
3807   \let\org@nocite\nocite
3808   \let\org@citex\citex
3809   \let\org@bibcite\bibcite
3810   \let\org@bibitem\@bibitem
3811 \fi

```

5.2 Marks

`\markright` Because the output routine is asynchronous, we must pass the current language attribute to the head lines. To achieve this we need to adapt the definition of `\markright` and `\markboth` somewhat. However, headlines and footlines can contain text outside marks; for that we must take some actions in the output routine if the 'headfoot' options is used. We need to make some redefinitions to the output routine to avoid an endless loop and to correctly handle the page number in bidi documents.

```

3812 \bbl@trace{Marks}
3813 \IfBabelLayout{sectioning}
3814 { \ifx\bbl@opt@headfoot\@nnil
3815   \g@addto@macro\@resetactivechars{%
3816     \set@typeset@protect
3817     \expandafter\select@language@x\expandafter{\bbl@main@language}%

3819     \ifcase\bbl@bidimode\else % Only with bidi. See also above
3820       \edef\thepage{%
3821         \noexpand\babelsublr{\unexpanded\expandafter{\thepage}}}%
3822     \fi}%
3823 \fi}
3824 {\ifbbl@single\else
3825   \bbl@ifunset{markright } \bbl@redefine\bbl@redefineroobust
3826   \markright#1{%
3827     \bbl@ifblank{#1}%
3828     {\org@markright{}}%
3829     {\toks@{#1}%
3830       \bbl@exp{%
3831         \\org@markright{\\protect\\foreignlanguage{\language}\language}%
3832         {\\protect\\bbl@restore@actives\the\toks@}}}%

```

`\markboth` The definition of `\markboth` is equivalent to that of `\markright`, except that we need two token registers. The documentclasses report and book define and set the headings for the page. While doing so they also store a copy of `\markboth` in `\@mkboth`. Therefore we need to check whether `\@mkboth` has already been set. If so we need to do that again with the new definition of `\markboth`. (As of Oct 2019, \TeX stores the definition in an intermediate macro, so it's not necessary anymore, but it's preserved for older versions.)

```

3833   \ifx\@mkboth\markboth
3834     \def\bbl@tempc{\let\@mkboth\markboth}%
3835   \else
3836     \def\bbl@tempc{%
3837       \fi

```

3849      \bbl@exp{\org@markboth{\the\toks@}{\the\temptokena}}}%
3850      \bbl@tempc
3851    \fi} % end ifbbl@single, end \IfBabelLayout

```

5.3 Preventing clashes with other packages

5.3.1 ifthen

`\ifthenelse` Sometimes a document writer wants to create a special effect depending on the page a certain fragment of text appears on. This can be achieved by the following piece of code:

```

\ifthenelse{\isodd{\pageref{some:label}}}{
  {code for odd pages}
}{
  {code for even pages}
}

```

In order for this to work the argument of `\isodd` needs to be fully expandable. With the above redefinition of `\pageref` it is not in the case of this example. To overcome that, we add some code to the definition of `\ifthenelse` to make things work.

We want to revert the definition of `\pageref` and `\ref` to their original definition for the first argument of `\ifthenelse`, so we first need to store their current meanings.

Then we can set the `\@safe@actives` switch and call the original `\ifthenelse`. In order to be able to use shorthands in the second and third arguments of `\ifthenelse` the resetting of the switch *and* the definition of `\pageref` happens inside those arguments.

```

3852 \bbl@trace{Preventing clashes with other packages}
3853 \ifx\org@ref\undefined\else
3854   \bbl@xin@{R}\bbl@opt@safe
3855   \ifin@
3856     \AtBeginDocument{%
3857       \@ifpackageloaded{ifthen}{%
3858         \bbl@redefine@long\ifthenelse#1#2#3{%
3859           \let\bbl@temp@pref\pageref
3860           \let\pageref\org@pageref
3861           \let\bbl@temp@ref\ref
3862           \let\ref\org@ref
3863           \@safe@activestrue
3864           \org@ifthenelse{#1}%
3865             {\let\pageref\bbl@temp@pref
3866              \let\ref\bbl@temp@ref
3867              \@safe@activesfalse
3868              #2}%
3869             {\let\pageref\bbl@temp@pref
3870              \let\ref\bbl@temp@ref
3871              \@safe@activesfalse
3872              #3}%
3873           }%
3874         }{}%
3875       }
3876 \fi

```

5.3.2 varioref

`\@vppageref` When the package `varioref` is in use we need to modify its internal command `\@vppageref` in order to prevent problems when an active character ends up in the argument of `\vref`. The same needs to happen for `\vrefpagenum`.

```

3877 \AtBeginDocument{%
3878   \@ifpackageloaded{varioref}{%
3879     \bbl@redefine\@vppageref#1[#2]#3{%
3880       \@safe@activestrue
3881       \org@@@vppageref{#1}[#2]#3}%
3882     \@safe@activesfalse}%
3883   \bbl@redefine\vrefpagenum#1#2{%
3884     \@safe@activestrue

```

```

3885 \org@vrefpagenum{#1}{#2}%
3886 \@safe@activesfalse}%

```

The package `varioref` defines `\Ref` to be a robust command which uppercases the first character of the reference text. In order to be able to do that it needs to access the expandable form of `\ref`. So we employ a little trick here. We redefine the (internal) command `\Ref_` to call `\org@ref` instead of `\ref`. The disadvantage of this solution is that whenever the definition of `\Ref` changes, this definition needs to be updated as well.

```

3887 \expandafter\def\csname Ref \endcsname#1{%
3888 \protected@edef\@tempa{\org@ref{#1}}\expandafter\MakeUppercase\@tempa}
3889 }{}%
3890 }
3891 \fi

```

5.3.3 `hhline`

`\hhline` Delaying the activation of the shorthand characters has introduced a problem with the `hhline` package. The reason is that it uses the ‘`’` character which is made active by the french support in `babel`. Therefore we need to *reload* the package when the ‘`’` is an active character. Note that this happens *after* the category code of the `@`-sign has been changed to other, so we need to temporarily change it to letter again.

```

3892 \AtEndOfPackage{%
3893 \AtBeginDocument{%
3894 \ifpackageloaded{hhline}%
3895 {\expandafter\ifx\csname normal@char\string\endcsname\relax
3896 \else
3897 \makeatletter
3898 \def\@currname{hhline}\input{hhline.sty}\makeatother
3899 \fi}%
3900 {}}}

```

`\substitutefontfamily` *Deprecated*. Use the tools provided by \TeX . The command `\substitutefontfamily` creates an `.fd` file on the fly. The first argument is an encoding mnemonic, the second and third arguments are font family names.

5.4 Encoding and fonts

Because documents may use non-ASCII font encodings, we make sure that the logos of \TeX and \LaTeX always come out in the right encoding. There is a list of non-ASCII encodings. Requested encodings are currently stored in `\@fontenc@load@list`. If a non-ASCII has been loaded, we define versions of `\TeX` and `\LaTeX` for them using `\ensureascii`. The default ASCII encoding is set, too (in reverse order): the “main” encoding (when the document begins), the last loaded, or OT1.

\ensureascii

```

3920 \bbl@trace{Encoding and fonts}
3921 \newcommand\BabelNonASCII{LGR,X2,OT2,OT3,OT6,LHE,LWN,LMA,LMC,LMS,LMU}
3922 \newcommand\BabelNonText{TS1,T3,TS3}
3923 \let\org@TeX\TeX
3924 \let\org@LaTeX\LaTeX
3925 \let\ensureascii\@firstofone
3926 \AtBeginDocument{%
3927   \def\elt#1{,#1,}%
3928   \edef\bbl@tempa{\expandafter\@gobbletwo\@fontenc@load@list}%
3929   \let\elt\relax
3930   \let\bbl@tempb\@empty
3931   \def\bbl@tempc{OT1}%
3932   \bbl@foreach\BabelNonASCII{% LGR loaded in a non-standard way
3933     \bbl@ifunset{T@#1}{\def\bbl@tempb{#1}}}%
3934   \bbl@foreach\bbl@tempa{%
3935     \bbl@xin@{#1}{\BabelNonASCII}%
3936     \ifin@
3937       \def\bbl@tempb{#1}% Store last non-ascii
3938     \else\bbl@xin@{#1}{\BabelNonText}% Pass
3939     \ifin@\else
3940       \def\bbl@tempc{#1}% Store last ascii
3941     \fi
3942   \fi}%
3943   \ifx\bbl@tempb\@empty\else
3944     \bbl@xin@{\cf@encoding,}{,\BabelNonASCII,\BabelNonText,}%
3945     \ifin@\else
3946       \edef\bbl@tempc{\cf@encoding}% The default if ascii wins
3947     \fi
3948     \edef\ensureascii#1{%
3949       {\noexpand\fontencoding{\bbl@tempc}\noexpand\selectfont#1}}%
3950     \DeclareTextCommandDefault{\TeX}{\ensureascii{\org@TeX}}%
3951     \DeclareTextCommandDefault{\LaTeX}{\ensureascii{\org@LaTeX}}%
3952   \fi}

```

Now comes the old deprecated stuff (with a little change in 3.9l, for fontspec). The first thing we need to do is to determine, at \begin{document}, which latin fontencoding to use.

\latinencoding When text is being typeset in an encoding other than 'latin' (OT1 or T1), it would be nice to still have Roman numerals come out in the Latin encoding. So we first assume that the current encoding at the end of processing the package is the Latin encoding.

```

3953 \AtEndOfPackage{\edef\latinencoding{\cf@encoding}}

```

But this might be overruled with a later loading of the package fontenc. Therefore we check at the execution of \begin{document} whether it was loaded with the T1 option. The normal way to do this (using \ifpackageloaded) is disabled for this package. Now we have to revert to parsing the internal macro \@filelist which contains all the filenames loaded.

```

3954 \AtBeginDocument{%
3955   \@ifpackageloaded{fontspec}%
3956   {\xdef\latinencoding{%
3957     \ifx\UTFencname\undefined
3958       EU\ifcase\bbl@engine\or2\or1\fi
3959     \else
3960       \UTFencname
3961     \fi}}%
3962   {\gdef\latinencoding{OT1}%
3963     \ifx\cf@encoding\bbl@t@one
3964       \xdef\latinencoding{\bbl@t@one}%
3965     \else
3966       \def\elt#1{,#1,}%
3967       \edef\bbl@tempa{\expandafter\@gobbletwo\@fontenc@load@list}%
3968       \let\elt\relax
3969       \bbl@xin@{,T1,}\bbl@tempa

```

```

3970      \ifin@
3971      \xdef\latinencoding{\bbl@t@one}%
3972      \fi
3973      \fi}}

```

`\latintext` Then we can define the command `\latintext` which is a declarative switch to a latin font-encoding. Usage of this macro is deprecated.

```

3974 \DeclareRobustCommand{\latintext}{%
3975   \fontencoding{\latinencoding}\selectfont
3976   \def\encodingdefault{\latinencoding}}

```

`\textlatin` This command takes an argument which is then typeset using the requested font encoding. In order to avoid many encoding switches it operates in a local scope.

```

3977 \ifx\@undefined\DeclareTextFontCommand
3978   \DeclareRobustCommand{\textlatin}[1]{\leavevmode{\latintext #1}}
3979 \else
3980   \DeclareTextFontCommand{\textlatin}{\latintext}
3981 \fi

```

For several functions, we need to execute some code with `\selectfont`. With \TeX 2021-06-01, there is a hook for this purpose.

```

3982 \def\bbl@patchfont#1{\AddToHook{selectfont}{#1}}

```

5.5 Basic bidi support

Work in progress. This code is currently placed here for practical reasons. It will be moved to the correct place soon, I hope.

It is loosely based on `rlbabel.def`, but most of it has been developed from scratch. This `babel` module (by Johannes Braams and Boris Lavva) has served the purpose of typesetting R documents for two decades, and despite its flaws I think it is still a good starting point (some parts have been copied here almost verbatim), partly thanks to its simplicity. I’ve also looked at `ARABI` (by Youssef Jabri), which is compatible with `babel`.

There are two ways of modifying macros to make them “bidi”, namely, by patching the internal low-level macros (which is what I have done with lists, columns, counters, tocs, much like `rlbabel` did), and by introducing a “middle layer” just below the user interface (sectioning, footnotes).

- `pdfTeX` provides a minimal support for bidi text, and it must be done by hand. Vertical typesetting is not possible.
- `xetex` is somewhat better, thanks to its font engine (even if not always reliable) and a few additional tools. However, very little is done at the paragraph level. Another challenging problem is text direction does not honour \TeX grouping.
- `luatex` can provide the most complete solution, as we can manipulate almost freely the node list, the generated lines, and so on, but bidi text does not work out of the box and some development is necessary. It also provides tools to properly set left-to-right and right-to-left page layouts. As `Lua \TeX -ja` shows, vertical typesetting is possible, too.

```

5.6 Local Language Configuration

`\loadlocalcfg` At some sites it may be necessary to add site-specific actions to a language definition file. This can be done by creating a file with the same name as the language definition file, but with the extension `.cfg`. For instance the file `norsk.cfg` will be loaded when the language definition file `norsk.ldf` is loaded.

For plain-based formats we don't want to override the definition of `\loadlocalcfg` from `plain.def`.

```

4156 \bbl@trace{Local Language Configuration}
4157 \ifx\loadlocalcfg\@undefined
4158   \ifpackagewith{babel}{noconfigs}%
4159     {\let\loadlocalcfg\@gobble}%
4160   {\def\loadlocalcfg#1{%
4161     \InputIfFileExists{#1.cfg}%

4163               * Local config file #1.cfg used^^J%
4164               *}}}%
4165     \@empty}}
4166 \fi

```

5.7 Language options

Languages are loaded when processing the corresponding option *except* if a main language has been set. In such a case, it is not loaded until all options has been processed. The following macro inputs the ldf file and does some additional checks (\input works, too, but possible errors are not caught).

```
4167 \bbl@trace{Language options}
4168 \let\bbl@afterlang\relax
4169 \let\BabelModifiers\relax
4170 \let\bbl@loaded@empty
4171 \def\bbl@load@language#1{%
4172   \InputIfFileExists{#1.ldf}%
4173   {\edef\bbl@loaded{\CurrentOption
4174     \ifx\bbl@loaded@empty\else,\bbl@loaded\fi}%
4175     \expandafter\let\expandafter\bbl@afterlang
4176     \csname\CurrentOption.ldf-h@k\endcsname
4177     \expandafter\let\expandafter\BabelModifiers
4178     \csname bbl@mod@\CurrentOption\endcsname
4179     \bbl@exp{\AtBeginDocument{%
4180       \bbl@usehooks@lang{\CurrentOption}{begindocument}{\CurrentOption}}}%
4181     {\bbl@error{%
4182       Unknown option '\CurrentOption'. Either you misspelled it\\%
4183       or the language definition file \CurrentOption.ldf was not found}%
4184       Valid options are, among others: shorthands=, KeepShorthandsActive,\\%
4185       activeacute, activegrave, noconfigs, safe=, main=, math=\\%
4186       headfoot=, strings=, config=, hyphenmap=, or a language name.}}}
```

Now, we set a few language options whose names are different from ldf files. These declarations are preserved for backwards compatibility, but they must be eventually removed. Use proxy files instead.

```
4187 \def\bbl@try@load@lang#1#2#3{%
4188   \IfFileExists{\CurrentOption.ldf}%
4189   {\bbl@load@language{\CurrentOption}}%
4190   {#1\bbl@load@language{#2#3}}
4191 %
4192 \DeclareOption{hebrew}{%
4193   \input{rlbabel.def}%
4194   \bbl@load@language{hebrew}}
4195 \DeclareOption{hungarian}{\bbl@try@load@lang{}{magyar}{}}
4196 \DeclareOption{lowersorbian}{\bbl@try@load@lang{}{lsorbian}{}}
4197 \DeclareOption{northersami}{\bbl@try@load@lang{}{samin}{}}
4198 \DeclareOption{nynorsk}{\bbl@try@load@lang{}{norsk}{}}
4199 \DeclareOption{polutonikogreek}{%
4200   \bbl@try@load@lang{}{greek}{\languageattribute{greek}{polutoniko}}}
4201 \DeclareOption{russian}{\bbl@try@load@lang{}{russianb}{}}
4202 \DeclareOption{scottishgaelic}{\bbl@try@load@lang{}{scottish}{}}
4203 \DeclareOption{ukrainian}{\bbl@try@load@lang{}{ukraineb}{}}
4204 \DeclareOption{uppersorbian}{\bbl@try@load@lang{}{usorbian}{}}
```

Another way to extend the list of ‘known’ options for babel was to create the file `bblopts.cfg` in which one can add option declarations. However, this mechanism is deprecated – if you want an alternative name for a language, just create a new `.ldf` file loading the actual one. You can also set the name of the file with the package option `config=<name>`, which will load `<name>.cfg` instead.

```
4205 \ifx\bbl@opt@config\@nnil
4206   \ifpackagewith{babel}{noconfigs}{}%
4207   {\InputIfFileExists{bblopts.cfg}%
4208     {\typeout{*****^J%
4209       * Local config file bblopts.cfg used^^J%
4210       *}}%
4211     {}}%
4212 \else
4213   \InputIfFileExists{\bbl@opt@config.cfg}%
4214   {\typeout{*****^J%
4215     * Local config file \bbl@opt@config.cfg used^^J%
4216     *}}%
```

```

4217 {\bbl@error{%
4218     Local config file '\bbl@opt@config.cfg' not found}{%
4219     Perhaps you misspelled it.}}%
4220 \fi

```

Recognizing global options in packages not having a closed set of them is not trivial, as for them to be processed they must be defined explicitly. So, package options not yet taken into account and stored in `bbl@language@opts` are assumed to be languages. If not declared above, the names of the option and the file are the same. We first pre-process the class and package options to determine the main language, which is processed in the third ‘main’ pass, *except* if all files are `ldf` and there is no main key. In the latter case (`bbl@opt@main` is still `\@nnil`), the traditional way to set the main language is kept — the last loaded is the main language.

```

4221 \ifx\bbl@opt@main\@nnil
4222   \ifnum\bbl@iniflag>\z@ % if all ldf's: set implicitly, no main pass
4223     \let\bbl@tempb\@empty
4224     \edef\bbl@tempa{\@classoptionslist,\bbl@language@opts}%

4271       \bbl@ldfinit
4272       \babelprovide[import]{#1}%
4273       \bbl@afterldf{}}}%
4274     {}%
4275     \fi
4276   \fi}

```

And we are done, because all options for this pass has been declared. Those already processed in the first pass are just ignored.

The options have to be processed in the order in which the user specified them (but remember class options are processed before):

```

4277 \def\AfterBabelLanguage#1{%
4278   \bbl@ifsamestring\CurrentOption{#1}{\global\bbl@add\bbl@afterlang{}}
4279 \DeclareOption*{}
4280 \ProcessOptions*

```

This finished the second pass. Now the third one begins, which loads the main language set with the key main. A warning is raised if the main language is not the same as the last named one, or if the value of the key main is not a language. With some options in provide, the package luatexbase is loaded (and immediately used), and therefore \babelprovide can't go inside a \DeclareOption; this explains why it's executed directly, with a dummy declaration. Then all languages have been loaded, so we deactivate \AfterBabelLanguage.

```

6 The kernel of Babel (babel.def, common)

The kernel of the babel system is currently stored in babel.def. The file babel.def contains most of the code. The file hyphen.cfg is a file that can be loaded into the format, which is necessary when you want to be able to switch hyphenation patterns.

Because plain T_EX users might want to use some of the features of the babel system too, care has to be taken that plain T_EX can process the files. For this reason the current format will have to be checked in a number of places. Some of the code below is common to plain T_EX and L^AT_EX, some of it is for the L^AT_EX case only.

Plain formats based on etex (etex, xetex, luatex) don't load hyphen.cfg but etex.src, which follows a different naming convention, so we need to define the babel names. It presumes language.def exists and it is the same file used when formats were created.

A proxy file for switch.def

```

4335 \kernel
4336 \let\bbl@onlyswitch\@empty
4337 \input babel.def
4338 \let\bbl@onlyswitch\@undefined
4339 \end{kernel}
4340 \patterns

```

7 Loading hyphenation patterns

The following code is meant to be read by iniT_EX because it should instruct T_EX to read hyphenation patterns. To this end the docstrip option patterns is used to include this code in the file hyphen.cfg. Code is written with lower level macros.

```

4341 \Make sure ProvidesFile is defined
4342 \ProvidesFile{hyphen.cfg}[<date>] v<version> Babel hyphens]
4343 \xdef\bbl@format{\jobname}
4344 \def\bbl@version{<version>}
4345 \def\bbl@date{<date>}
4346 \ifx\AtBeginDocument\undefined
4347   \def\@empty{}
4348 \fi
4349 \Define core switching macros

```

\process@line Each line in the file language.dat is processed by \process@line after it is read. The first thing this macro does is to check whether the line starts with =. When the first token of a line is an =, the macro \process@synonym is called; otherwise the macro \process@language will continue.

```

4350 \def\process@line#1#2 #3 #4 {%
4351   \ifx=#1%
4352     \process@synonym{#2}%

```

```

4353 \else
4354 \process@language{#1#2}{#3}{#4}%
4355 \fi
4356 \ignorespaces}

```

`\process@synonym` This macro takes care of the lines which start with an `=`. It needs an empty token register to begin with. `\bbl@languages` is also set to empty.

```

4357 \toks@{}
4358 \def\bbl@languages{}

```

When no languages have been loaded yet, the name following the `=` will be a synonym for hyphenation register 0. So, it is stored in a token register and executed when the first pattern file has been processed. (The `\relax` just helps to the `\if` below catching synonyms without a language.) Otherwise the name will be a synonym for the language loaded last. We also need to copy the hyphenmin parameters for the synonym.

```

4359 \def\process@synonym#1{%
4360 \ifnum\last@language=\m@ne
4361 \toks@\expandafter{\the\toks@\relax\process@synonym{#1}}%
4362 \else
4363 \expandafter\chardef\csname l@#1\endcsname\last@language
4364 \wlog{\string\l@#1=\string\language\the\last@language}%
4365 \expandafter\let\csname #1hyphenmins\expandafter\endcsname
4366 \csname\language\hyphenmins\endcsname
4367 \let\bbl@elt\relax
4368 \edef\bbl@languages{\bbl@languages\bbl@elt{#1}{\the\last@language}}}%
4369 \fi}

```

`\process@language` The macro `\process@language` is used to process a non-empty line from the ‘configuration file’. It has three arguments, each delimited by white space. The first argument is the ‘name’ of a language; the second is the name of the file that contains the patterns. The optional third argument is the name of a file containing hyphenation exceptions.

The first thing to do is call `\addlanguage` to allocate a pattern register and to make that register ‘active’. Then the pattern file is read.

For some hyphenation patterns it is needed to load them with a specific font encoding selected. This can be specified in the file `language.dat` by adding for instance ‘:T1’ to the name of the language.

The macro `\bbl@get@enc` extracts the font encoding from the language name and stores it in `\bbl@hyph@enc`. The latter can be used in hyphenation files if you need to set a behavior depending on the given encoding (it is set to empty if no encoding is given).

Pattern files may contain assignments to `\lefthyphenmin` and `\righthyphenmin`. \TeX does not keep track of these assignments. Therefore we try to detect such assignments and store them in the `\langle lang \rangle hyphenmins` macro. When no assignments were made we provide a default setting.

Some pattern files contain changes to the `\lccode` or `\uccode` arrays. Such changes should remain local to the language; therefore we process the pattern file in a group; the `\patterns` command acts globally so its effect will be remembered.

Then we globally store the settings of `\lefthyphenmin` and `\righthyphenmin` and close the group.

When the hyphenation patterns have been processed we need to see if a file with hyphenation exceptions needs to be read. This is the case when the third argument is not empty and when it does not contain a space token. (Note however there is no need to save hyphenation exceptions into the format.)

`\bbl@languages` saves a snapshot of the loaded languages in the form

`\bbl@elt{<language-name>}{<number>}{<patterns-file>}{<exceptions-file>}`. Note the last 2 arguments are empty in ‘dialects’ defined in `language.dat` with `=`. Note also the language name can have encoding info.

Finally, if the counter `\language` is equal to zero we execute the synonyms stored.

```

4370 \def\process@language#1#2#3{%
4371 \expandafter\addlanguage\csname l@#1\endcsname
4372 \expandafter\language\csname l@#1\endcsname

4477 \chardef\l@english\z@
4478 \else

```

Pattern registers are allocated using count register `\last@language`. Its initial value is 0. The definition of the macro `\newlanguage` is such that it first increments the count register and then defines the language. In order to have the first patterns loaded in pattern register number 0 we initialize `\last@language` with the value `-1`.

```

4479 \last@language\m@ne

```

We now read lines from the file until the end is found. While reading from the input, it is useful to switch off recognition of the end-of-line character. This saves us stripping off spaces from the contents of the control sequence.

```

4480 \loop
4481 \endlinechar\m@ne
4482 \read1 to \bbl@line
4483 \endlinechar\^M

```

If the file has reached its end, exit from the loop here. If not, empty lines are skipped. Add 3 space characters to the end of `\bbl@line`. This is needed to be able to recognize the arguments of `\process@line` later on. The default language should be the very first one.

```
4484 \if T\ifeof1F\fi T\relax
4485 \ifx\bbl@line\@empty\else
4486 \edef\bbl@line{\bbl@line\space\space\space}%
4487 \expandafter\process@line\bbl@line\relax
4488 \fi
4489 \repeat
```

Check for the end of the file. We must reverse the test for `\ifeof` without `\else`. Then reactivate the default patterns, and close the configuration file.

```
4490 \begingroup
4491 \def\bbl@elt#1#2#3#4{%

4514 \</patterns>
```

Here the code for `iniTEX` ends.

8 Font handling with fontspec

Add the bidi handler just before `luaotfload`, which is loaded by default by LaTeX. Just in case, consider the possibility it has not been loaded. First, a couple of definitions related to bidi [misplaced].

```
4515 <<{*More package options}>> ≡
4516 \chardef\bbl@bidimode\z@
4517 \DeclareOption{bidi=default}{\chardef\bbl@bidimode=\@ne}
4518 \DeclareOption{bidi=basic}{\chardef\bbl@bidimode=101 }
4519 \DeclareOption{bidi=basic-r}{\chardef\bbl@bidimode=102 }
4520 \DeclareOption{bidi=bidi}{\chardef\bbl@bidimode=201 }
4521 \DeclareOption{bidi=bidi-r}{\chardef\bbl@bidimode=202 }
4522 \DeclareOption{bidi=bidi-l}{\chardef\bbl@bidimode=203 }
4523 <</More package options>>
```

With explicit languages, we could define the font at once, but we don't. Just wait and see if the language is actually activated. `bbl@font` replaces hardcoded font names inside `\..family` by the corresponding macro `\..default`.

At the time of this writing, fontspec shows a warning about there are languages not available, which some people think refers to babel, even if there is nothing wrong. Here is hack to patch fontspec to avoid the misleading (and mostly unuseful) message.

```

4524 <<*Font selection>> ≡
4525 \bbl@trace{Font handling with fontspec}

Now the macros defining the font with fontspec.

When there are repeated keys in fontspec, the last value wins. So, we just place the ini settings at the beginning, and user settings will take precedence. We must deactivate temporarily \bbl@mapselect because \selectfont is called internally when a font is defined.

For historical reasons, \TeX can select two different series (bx and b), for what is conceptually a single one. This can lead to problems when a single family requires several fonts, depending on the language, mainly because 'substitutions' with some combinations are not done consistently – sometimes bx/sc is the correct font, but sometimes points to b/n, even if b/sc exists. So, some substitutions are redefined (in a somewhat hackish way, by inspecting if the variant declaration contains >ssub*).

```

9.2 Layout

Note elements like headlines and margins can be modified easily with packages like fancyhdr, typearea or titles, and geometry.

\bbl@startskip and \bbl@endskip are available to package authors. Thanks to the \TeX expansion mechanism the following constructs are valid: \adim\bbl@startskip, \advance\bbl@startskip\adim, \bbl@startskip\adim.

Consider txtbabel as a shorthand for *tex-xet babel*, which is the bidi model in both pdftex and xetex.

9.4 LuaTeX

The loader for luatex is based solely on `language.dat`, which is read on the fly. The code shouldn't be executed when the format is build, so we check if `\AddBabelHook` is defined. Then comes a modified version of the loader in `hyphen.cfg` (without the `hyphenmins` stuff, which is under the direct control of `babel`).

The names `\l@<language>` are defined and take some value from the beginning because all `ldf` files assume this for the corresponding language to be considered valid, but patterns are not loaded (except the first one). This is done later, when the language is first selected (which usually means when the `ldf` finishes). If a language has been loaded, `\bbl@hyphendata@<num>` exists (with the names of the files read).

The default setup preloads the first language into the format. This is intended mainly for 'english', so that it's available without further intervention from the user. To avoid duplicating it, the following rule applies: if the "0th" language and the first language in `language.dat` have the same name then just ignore the latter. If there are new synonymous, they are added, but note if the language patterns have not been preloaded they won't at run time.

Other preloaded languages could be read twice, if they have been preloaded into the format. This is not optimal, but it shouldn't happen very often – with luatex patterns are best loaded when the document is typeset, and the "0th" language is preloaded just for backwards compatibility.

As of 1.1b, lua(e)tex is taken into account. Formerly, loading of patterns on the fly didn't work in this format, but with the new loader it does. Unfortunately, the format is not based on `babel`, and data could be duplicated, because languages are reassigned above those in the format (nothing serious, anyway). Note even with this format `language.dat` is used (under the principle of a single source), instead of `language.def`.

Of course, there is room for improvements, like tools to read and reassign languages, which would require modifying the language list, and better error handling.

We need catcode tables, but no format (targeted by `babel`) provide a command to allocate them (although there are packages like `ctablestack`). FIX - This isn't true anymore. For the moment, a dangerous approach is used - just allocate a high random number and cross the fingers. To

complicate things, etex.sty changes the way languages are allocated.

This files is read at three places: (1) when plain.def, babel.sty starts, to read the list of available languages from language.dat (for the base option); (2) at hyphen.cfg, to modify some macros; (3) in the middle of plain.def and babel.sty, by babel.def, with the commands and other definitions for luatex (eg, \babelpatterns).

`\babelpatterns` This macro adds patterns. Two macros are used to store them: `\bbl@patterns@` for the global ones and `\bbl@patterns@<lang>` for language ones. We make sure there is a space between words when multiple commands are used.

```

```

9.5 Southeast Asian scripts

First, some general code for line breaking, used by `\babelposthyphenation`. Replace regular (ie, implicit) discretionaries by spaceskips, based on the previous glyph (which I think makes sense, because the hyphen and the previous char go always together). Other discretionaries are not touched. See Unicode UAX 14.

```

9.6 CJK line breaking

Minimal line breaking for CJK scripts, mainly intended for simple documents and short texts as a secondary language. Only line breaking, with a little stretching for justification, without any attempt to adjust the spacing. It is based on (but does not strictly follow) the Unicode algorithm.

We first need a little table with the corresponding line breaking properties. A few characters have an additional key for the width (fullwidth vs. halfwidth), not yet used. There is a separate file, defined below.

```

9.9 Automatic fonts and ids switching

After defining the blocks for a number of scripts (must be extended and very likely fine tuned), we define a short function which just traverse the node list to carry out the replacements. The table `loc_to_scr` gets the locale form a script range (note the locale is the key, and that there is an intermediate table built on the fly for optimization). This locale is then used to get the `\language` and the `\localeid` as stored in `locale_props`, as well as the font (as requested). In the latter table a key starting with `/` maps the font from the global one (the key) to the local one (the value). Maths are skipped and discretionaries are handled in a special way.

Post-handling hyphenation patterns for non-standard rules, like ff to ff-f. There are still some issues with speed (not very slow, but still slow). The Lua code is below.

```

5917 \directlua{
5918   Babel.nohyphenation = \the\l@nohyphenation
5919 }

```

Now the \TeX high level interface, which requires the function defined above for converting strings to functions returning a string. These functions handle the $\{n\}$ syntax. For example, $\text{pre}=\{1\}\{1\}$ becomes $\text{function}(m) \text{ return } m[1]..m[1]..'-'$ end, where m are the matches returned after applying the pattern. With a mapped capture the functions are similar to $\text{function}(m) \text{ return } \text{Babel.capt_map}(m[1],1) \text{ end}$, where the last argument identifies the mapping to be applied to $m[1]$. The way it is carried out is somewhat tricky, but the effect is not dissimilar to lua load – save the code as string in a \TeX macro, and expand this macro at the appropriate place. As \directlua does not take into account the current catcode of $@$, we just avoid this character in macro names (which explains the internal group, too).

```

```

The following experimental (and unfinished) macro applies the prehyphenation transforms for the current locale to a string (characters and spaces) and processes it in a fully expandable way (among other limitations, the string can't contain]=}). The way it operates is admittedly rather cumbersome: it converts the string to a node list, processes it, and converts it back to a string. The lua code is in the lua file below.

```

6103 \newcommand\localeprehyphenation[1]{%
6104   \directlua{ Babel.string_prehyphenation([=[#1]=], \the\localeid) }}

```

9.10 Bidi

As a first step, add a handler for bidi and digits (and potentially other processes) just before luaotfload is applied, which is loaded by default by \LaTeX . Just in case, consider the possibility it has not been loaded.

```

9.11 Layout

Unlike xetex, luatex requires only minimal changes for right-to-left layouts, particularly in monolingual documents (the engine itself reverses boxes – including column order or headings –, margins, etc.) with `bidi=basic`, without having to patch almost any macro where text direction is relevant.

Still, there are three areas deserving special attention, namely, tabular, math, and graphics, text and intrinsically left-to-right elements are intermingled. I’ve made some progress in graphics, but they’re essentially hacks; I’ve also made some progress in ‘tabular’, but when I decided to tackle math (both standard math and ‘amsmath’) the nightmare began. I’m still not sure how ‘amsmath’ should be modified, but the main problem is that, boxes are “generic” containers that can hold text, math, and graphics (even at the same time; remember that inline math is included in the list of text nodes marked with ‘math’ (11) nodes too).

`\@hangfrom` is useful in many contexts and it is redefined always with the layout option.

There are, however, a number of issues when the text direction is not the same as the box direction (as set by `\bodydir`), and when `\parbox` and `\hangindent` are involved. Fortunately, latest releases of luatex simplify a lot the solution with `\shapemode`.

With the issue #15 I realized commands are best patched, instead of redefined. With a few lines, a modification could be applied to several classes and packages. Now, tabular seems to work (at least in simple cases) with array, tabularx, hhline, colortbl, longtable, booktabs, etc. However, dcolumn still fails.

```

OMEGA provided a companion to `\mathdir` (`\nextfakemath`) for those cases where we did not want it to be applied, so that the writing direction of the main text was left unchanged. `\bbbl@nextfake` is an attempt to emulate it, because `luatex` has removed it without an alternative. Also, `\hangindent` does not honour direction changes by default, so we need to redefine `\@hangfrom`.

```

9.12 Lua: transforms

After declaring the table containing the patterns with their replacements, we define some auxiliary functions: `str_to_nodes` converts the string returned by a function to a node list, taking the node at `base` as a model (font, language, etc.); `fetch_word` fetches a series of glyphs and discretionaries, which pattern is matched against (if there is a match, it is called again before trying other patterns, and this is very likely the main bottleneck).

`post_hyphenate_replace` is the callback applied after `lang.hyphenate`. This means the automatic hyphenation points are known. As empty captures return a byte position (as explained in the `luatex` manual), we must convert it to a utf8 position. With `first`, the last byte can be the leading byte in a utf8 sequence, so we just remove it and add 1 to the resulting length. With `last` we must take into account the capture position points to the next character. Here `word_head` points to the starting node of the text to be matched.

```

```

9.13 Lua: Auto bidi with basic and basic-r

The file `babel-data-bidi.lua` currently only contains data. It is a large and boring file and it is not shown here (see the generated file), but here is a sample:

```

[0x25]={d='et'},
[0x26]={d='on'},
[0x27]={d='on'},
[0x28]={d='on', m=0x29},
[0x29]={d='on', m=0x28},
[0x2A]={d='on'},
[0x2B]={d='es'},
[0x2C]={d='cs'},

```

For the meaning of these codes, see the Unicode standard.

Now the `basic-r` bidi mode. One of the aims is to implement a fast and simple bidi algorithm, with a single loop. I managed to do it for R texts, with a second smaller loop for a special case. The code is still somewhat chaotic, but its behavior is essentially correct. I cannot resist copying the following text from Emacs `bidi.c` (which also attempts to implement the bidi algorithm with a single loop):

Arrrgh!! The UAX#9 algorithm is too deeply entrenched in the assumption of batch-style processing [...]. May the fleas of a thousand camels infest the armpits of those who design supposedly general-purpose algorithms by looking at their own implementations, and fail to consider other possible implementations!

Well, it took me some time to guess what the batch rules in UAX#9 actually mean (in other word, *what* they do and *why*, and not only *how*), but I think (or I hope) I've managed to understand them. In some sense, there are two bidi modes, one for numbers, and the other for text. Furthermore, setting just the direction in R text is not enough, because there are actually *two* R modes (set explicitly in Unicode with RLM and ALM). In `babel` the `dir` is set by a higher protocol based on the `language/script`, which in turn sets the correct `dir` (<l>, <r> or <al>).

From UAX#9: “Where available, markup should be used instead of the explicit formatting characters”. So, this simple version just ignores formatting characters. Actually, most of that annex is devoted to how to handle them.

BD14-BD16 are not implemented. Unicode (and the W3C) are making a great effort to deal with some special problematic cases in “streamed” plain text. I don’t think this is the way to go – particular

issues should be fixed by a high level interface taking into account the needs of the document. And here is where luatex excels, because everything related to bidi writing is under our control.

```

7168 (*basic-r)
7169 Babel = Babel or {}
7170
7171 Babel.bidi_enabled = true
7172
7173 require('babel-data-bidi.lua')
7174
7175 local characters = Babel.characters
7176 local ranges = Babel.ranges
7177
7178 local DIR = node.id("dir")
7179
7180 local function dir_mark(head, from, to, outer)
7181   dir = (outer == 'r') and 'TLT' or 'TRT' -- ie, reverse
7182   local d = node.new(DIR)
7183   d.dir = '+' .. dir
7184   node.insert_before(head, from, d)
7185   d = node.new(DIR)
7186   d.dir = '-' .. dir
7187   node.insert_after(head, to, d)
7188 end
7189
7190 function Babel.bidi(head, ispar)
7191   local first_n, last_n          -- first and last char with nums
7192   local last_es                  -- an auxiliary 'last' used with nums
7193   local first_d, last_d          -- first and last char in L/R block
7194   local dir, dir_real

```

Next also depends on script/lang (<al>/<r>). To be set by babel. tex.pardir is dangerous, could be (re)set but it should be changed only in vmode. There are two strong's – strong = l/al/r and strong_lr = l/r (there must be a better way):

```

7195   local strong = ('TRT' == tex.pardir) and 'r' or 'l'
7196   local strong_lr = (strong == 'l') and 'l' or 'r'
7197   local outer = strong
7198
7199   local new_dir = false
7200   local first_dir = false
7201   local inmath = false
7202
7203   local last_lr
7204
7205   local type_n = ''
7206
7207   for item in node.traverse(head) do
7208
7209     -- three cases: glyph, dir, otherwise
7210     if item.id == node.id'glyph'
7211       or (item.id == 7 and item.subtype == 2) then
7212
7213       local itemchar
7214       if item.id == 7 and item.subtype == 2 then
7215         itemchar = item.replace.char
7216       else
7217         itemchar = item.char
7218       end
7219       local chardata = characters[itemchar]
7220       dir = chardata and chardata.d or nil
7221       if not dir then
7222         for nn, et in ipairs(ranges) do
7223           if itemchar < et[1] then
7224             break

```

```

7225         elseif itemchar <= et[2] then
7226             dir = et[3]
7227             break
7228         end
7229     end
7230 end
7231 dir = dir or 'l'
7232 if inmath then dir = ('TRT' == tex.mathdir) and 'r' or 'l' end

```

Next is based on the assumption babel sets the language AND switches the script with its dir. We treat a language block as a separate Unicode sequence. The following piece of code is executed at the first glyph after a 'dir' node. We don't know the current language until then. This is not exactly true, as the math mode may insert explicit dirs in the node list, so, for the moment there is a hack by brute force (just above).

```

7233 if new_dir then
7234     attr_dir = 0
7235     for at in node.traverse(item.attr) do
7236         if at.number == Babel.attr_dir then
7237             attr_dir = at.value & 0x3
7238         end
7239     end
7240     if attr_dir == 1 then
7241         strong = 'r'
7242     elseif attr_dir == 2 then
7243         strong = 'al'
7244     else
7245         strong = 'l'
7246     end
7247     strong_lr = (strong == 'l') and 'l' or 'r'
7248     outer = strong_lr
7249     new_dir = false
7250 end
7251
7252 if dir == 'nsm' then dir = strong end -- W1

```

Numbers. The dual <al>/<r> system for R is somewhat cumbersome.

```

7253 dir_real = dir -- We need dir_real to set strong below
7254 if dir == 'al' then dir = 'r' end -- W3

```

By W2, there are no <en> <et> <es> if strong == <al>, only <an>. Therefore, there are not <et en> nor <en et>, W5 can be ignored, and W6 applied:

```

7255 if strong == 'al' then
7256     if dir == 'en' then dir = 'an' end -- W2
7257     if dir == 'et' or dir == 'es' then dir = 'on' end -- W6
7258     strong_lr = 'r' -- W3
7259 end

```

Once finished the basic setup for glyphs, consider the two other cases: dir node and the rest.

```

7260 elseif item.id == node.id'dir' and not inmath then
7261     new_dir = true
7262     dir = nil
7263 elseif item.id == node.id'math' then
7264     inmath = (item.subtype == 0)
7265 else
7266     dir = nil -- Not a char
7267 end

```

Numbers in R mode. A sequence of <en>, <et>, <an>, <es> and <cs> is typeset (with some rules) in L mode. We store the starting and ending points, and only when anything different is found (including nil, ie, a non-char), the textdir is set. This means you cannot insert, say, a whatsit, but this is what I would expect (with luacolor you may colorize some digits). Anyway, this behavior could be changed with a switch in the future. Note in the first branch only <an> is relevant if <al>.

```

7268 if dir == 'en' or dir == 'an' or dir == 'et' then
7269     if dir ~= 'et' then

```

```

7270     type_n = dir
7271     end
7272     first_n = first_n or item
7273     last_n = last_es or item
7274     last_es = nil
7275     elseif dir == 'es' and last_n then -- W3+W6
7276         last_es = item
7277     elseif dir == 'cs' then           -- it's right - do nothing
7278     elseif first_n then -- & if dir = any but en, et, an, es, cs, inc nil
7279         if strong_lr == 'r' and type_n ~= '' then
7280             dir_mark(head, first_n, last_n, 'r')
7281         elseif strong_lr == 'l' and first_d and type_n == 'an' then
7282             dir_mark(head, first_n, last_n, 'r')
7283             dir_mark(head, first_d, last_d, outer)
7284             first_d, last_d = nil, nil
7285         elseif strong_lr == 'l' and type_n ~= '' then
7286             last_d = last_n
7287         end
7288         type_n = ''
7289         first_n, last_n = nil, nil
7290     end

```

R text in L, or L text in R. Order of dir_ mark's are relevant: d goes outside n, and therefore it's emitted after. See dir_mark to understand why (but is the nesting actually necessary or is a flat dir structure enough?). Only L, R (and AL) chars are taken into account – everything else, including spaces, whatsits, etc., are ignored:

```

7291     if dir == 'l' or dir == 'r' then
7292         if dir ~= outer then
7293             first_d = first_d or item
7294             last_d = item
7295         elseif first_d and dir ~= strong_lr then
7296             dir_mark(head, first_d, last_d, outer)
7297             first_d, last_d = nil, nil
7298         end
7299     end

```

Mirroring. Each chunk of text in a certain language is considered a “closed” sequence. If <r on r> and <l on l>, it's clearly <r> and <l>, resptly, but with other combinations depends on outer. From all these, we select only those resolving <on> → <r>. At the beginning (when last_lr is nil) of an R text, they are mirrored directly.

TODO - numbers in R mode are processed. It doesn't hurt, but should not be done.

```

7300     if dir and not last_lr and dir ~= 'l' and outer == 'r' then
7301         item.char = characters[item.char] and
7302             characters[item.char].m or item.char
7303     elseif (dir or new_dir) and last_lr ~= item then
7304         local mir = outer .. strong_lr .. (dir or outer)
7305         if mir == 'rrr' or mir == 'lrr' or mir == 'rrl' or mir == 'rlr' then
7306             for ch in node.traverse(node.next(last_lr)) do
7307                 if ch == item then break end
7308                 if ch.id == node.id'glyph' and characters[ch.char] then
7309                     ch.char = characters[ch.char].m or ch.char
7310                 end
7311             end
7312         end
7313     end

```

Save some values for the next iteration. If the current node is 'dir', open a new sequence. Since dir could be changed, strong is set with its real value (dir_real).

```

7314     if dir == 'l' or dir == 'r' then
7315         last_lr = item
7316         strong = dir_real           -- Don't search back - best save now
7317         strong_lr = (strong == 'l') and 'l' or 'r'
7318     elseif new_dir then
7319         last_lr = nil

```

```

7320     end
7321 end

```

Mirror the last chars if they are no directed. And make sure any open block is closed, too.

```

7322 if last_lr and outer == 'r' then
7323     for ch in node.traverse_id(node.id'glyph', node.next(last_lr)) do
7324         if characters[ch.char] then
7325             ch.char = characters[ch.char].m or ch.char
7326         end
7327     end
7328 end
7329 if first_n then
7330     dir_mark(head, first_n, last_n, outer)
7331 end
7332 if first_d then
7333     dir_mark(head, first_d, last_d, outer)
7334 end

```

In boxes, the dir node could be added before the original head, so the actual head is the previous node.

```

7335 return node.prev(head) or head
7336 end
7337 </basic-r>

```

And here the Lua code for bidi=basic:

```

7338 (*basic)

10 Data for CJK

It is a boring file and it is not shown here (see the generated file), but here is a sample:

```

[0x0021]={c='ex'},
[0x0024]={c='pr'},
[0x0025]={c='po'},
[0x0028]={c='op'},
[0x0029]={c='cp'},
[0x002B]={c='pr'},

```

For the meaning of these codes, see the Unicode standard.

11 The ‘nil’ language

This ‘language’ does nothing, except setting the hyphenation patterns to nohyphenation.

For this language currently no special definitions are needed or available.

The macro `\LdfInit` takes care of preventing that this file is loaded more than once, checking the category code of the `@` sign, etc.

```

7762 <*nil>
7763 \ProvidesLanguage{nil}[\<<date>> v\<<version>> Nil language]
7764 \LdfInit{nil}{datenil}

```

When this file is read as an option, i.e. by the `\usepackage` command, `nil` could be an ‘unknown’ language in which case we have to make it known.

```

7765 \ifx\l@nil\undefined

```

The macro `\ldf@finish` takes care of looking for a configuration file, setting the main language to be switched on at `\begin{document}` and resetting the category code of `@` to its original value.

```

7803 \ldf@finish{nil}
7804 </nil>

```

12 Calendars

The code for specific calendars are placed in the specific files, loaded when requested by an ini file in the identification section with `require.calendars`.

Start with function to compute the Julian day. It's based on the little library `calendar.js`, by John Walker, in the public domain.

```

7805 <<Compute Julian day>> ≡
7806 \def\bbl@fpmmod#1#2{(#1-#2*floor(#1/#2))}
7807 \def\bbl@cs@gregleap#1{%
7808   (\bbl@fpmmod{#1}{4} == 0) &&
7809   (!((\bbl@fpmmod{#1}{100} == 0) && (\bbl@fpmmod{#1}{400} != 0)))}
7810 \def\bbl@cs@jd#1#2#3{% year, month, day
7811   \fp_eval:n{ 1721424.5 + (365 * (#1 - 1)) +
7812     floor((#1 - 1) / 4) + (-floor((#1 - 1) / 100)) +
7813     floor((#1 - 1) / 400) + floor(((367 * #2) - 362) / 12) +
7814     ((#2 <= 2) ? 0 : (\bbl@cs@gregleap{#1} ? -1 : -2)) + #3 } }
7815 <</Compute Julian day>>

```

12.1 Islamic

The code for the Civil calendar is based on it, too.

```

12.3 Persian

There is an algorithm written in TeX by Jabri, Abolhassani, Pournader and Esfahbod, created for the first versions of the FarsiTeX system (no longer available), but the original license is GPL, so its use with LPL is problematic. The code here follows loosely that by John Walker, which is free and accurate, but sadly very complex, so the relevant data for the years 2013-2050 have been pre-calculated and stored. Actually, all we need is the first day (either March 20 or March 21).

13 Support for Plain T_EX (plain.def)

13.1 Not renaming hyphen.tex

As Don Knuth has declared that the filename `hyphen.tex` may only be used to designate *his* version of the american English hyphenation patterns, a new solution has to be found in order to be able to load hyphenation patterns for other languages in a plain-based T_EX-format. When asked he responded:

That file name is “sacred”, and if anybody changes it they will cause severe upward/downward compatibility headaches.

People can have a file `localhyphen.tex` or whatever they like, but they mustn’t diddle with `hyphen.tex` (or `plain.tex` except to preload additional fonts).

The files `bplain.tex` and `lplain.tex` can be used as replacement wrappers around `plain.tex` and `lplain.tex` to achieve the desired effect, based on the `babel` package. If you load each of them with `iniTEX`, you will get a file called either `bplain.fmt` or `lplain.fmt`, which you can use as replacements for `plain.fmt` and `lplain.fmt`.

As these files are going to be read as the first thing \LaTeX sees, we need to set some category codes just to be able to change the definition of \input .

```
8287 <(*bplain | bplain)
8288 \catcode\{=1 % left brace is begin-group character
8289 \catcode\}=2 % right brace is end-group character
8290 \catcode\#=6 % hash mark is macro parameter character
```

If a file called `hyphen.cfg` can be found, we make sure that *it* will be read instead of the file `hyphen.tex`. We do this by first saving the original meaning of \input (and I use a one letter control sequence for that so as not to waste multi-letter control sequence on this in the format).

```
8291 \openin 0 hyphen.cfg
8292 \ifeof0
8293 \else
8294   \let\input
```

Then \input is defined to forget about its argument and load `hyphen.cfg` instead. Once that's done the original meaning of \input can be restored and the definition of \a can be forgotten.

```
8295   \def\input #1 {%
8296     \let\input\input
8297     \a hyphen.cfg
8298     \let\input\undefined
8299   }
8300 \fi
8301 </bplain | bplain>
```

Now that we have made sure that `hyphen.cfg` will be loaded at the right moment it is time to load `plain.tex`.

```
8302 <bplain>\a plain.tex
8303 <bplain>\a lplain.tex
```

Finally we change the contents of \fmtname to indicate that this is *not* the plain format, but a format based on plain with the `babel` package preloaded.

```
8304 <bplain>\def\fmtname{babel-plain}
8305 <bplain>\def\fmtname{babel-lplain}
```

When you are using a different format, based on `plain.tex` you can make a copy of `blplain.tex`, rename it and replace `plain.tex` with the name of your format file.

13.2 Emulating some \LaTeX features

The file `babel.def` expects some definitions made in the $\text{\LaTeX}_{2\epsilon}$ style file. So, in Plain we must provide at least some predefined values as well some tools to set them (even if not all options are available). There are no package options, and therefore an alternative mechanism is provided. For the moment, only $\text{\babeloptionstrings}$ and \babeloptionmath are provided, which can be defined before loading `babel`. \BabelModifiers can be set too (but not sure it works).

```
8306 <<(*Emulate LaTeX)>> \equiv
8307 \def\@empty{}
8308 \def\loadlocalcfg#1{%
8309   \openin0#1.cfg
8310   \ifeof0
8311     \closein0
8312   \else
8313     \closein0
8314     {\immediate\writel6{*****}%
8315      \immediate\writel6{* Local config file #1.cfg used}%
8316      \immediate\writel6{*}%
8317     }
8318     \input #1.cfg\relax
8319   \fi
8320 \endofldef}
```

13.3 General tools

A number of \LaTeX macro's that are needed later on.

The following little macro `\in@` is taken from `latex.ltx`; it checks whether its first argument is part of its second argument. It uses the boolean `\in@`; allocating a new boolean inside conditionally executed code is not possible, hence the construct with the temporary definition of `\bbl@tempa`.

```

```

\LaTeX has a macro to check whether a certain package was loaded with specific options. The command has two extra arguments which are code to be executed in either the true or false case. This is used to detect whether the document needs one of the accents to be activated (activegrave and activeacute). For plain \TeX we assume that the user wants them to be active by default. Therefore the only thing we do is execute the third argument (the code for the true case).

```

8477 \def\@ifpackagewith#1#2#3#4{#3}

```

The \LaTeX macro `\@ifl@aded` checks whether a file was loaded. This functionality is not needed for plain \TeX but we need the macro to be defined as a no-op.

```

8478 \def\@ifl@aded#1#2#3#4{}

```

For the following code we need to make sure that the commands `\newcommand` and `\providecommand` exist with some sensible definition. They are not fully equivalent to their \TeX versions; just enough to make things work in plain \TeX environments.

```
8479 \ifx\@tempcnta\undefined
8480   \csname newcount\endcsname\@tempcnta\relax
8481 \fi
8482 \ifx\@tempcntb\undefined
8483   \csname newcount\endcsname\@tempcntb\relax
8484 \fi
```

To prevent wasting two counters in \TeX (because counters with the same name are allocated later by it) we reset the counter that holds the next free counter (`\count10`).

14 Acknowledgements

I would like to thank all who volunteered as β -testers for their time. Michel Goossens supplied contributions for most of the other languages. Nico Poppelier helped polish the text of the documentation and supplied parts of the macros for the Dutch language. Paul Wackers and Werenfried Spit helped find and repair bugs. During the further development of the babel system I received much help from Bernd Raichle, for which I am grateful. There are also many contributors for specific languages, which are mentioned in the respective files. Without them, babel just wouldn't exist.
