Troubleshoooting

babel is being developed incrementally, which means parts of the code are under development and therefore incomplete. Only documented features are considered complete. In other words, use babel only as documented (except, of course, if you want to explore and test them – you can post suggestions about multilingual issues to kadingira@tug.org on <http://tug.org/mailman/listinfo/kadingira>).

1 Identification and loading of required files

Code documentation is still under revision.

The following description is no longer valid, because switch and plain have been merged into babel.def.

The babel package after unpacking consists of the following files:

switch.def defines macros to set and switch languages.

babel.def defines the rest of macros. It has two parts: a generic one and a second one only for LaTeX.

babel.sty is the \LaTeX package, which sets options and loads language styles.

plain.def defines some \LaTeX macros required by babel.def and provides a few tools for Plain.

hyphen.cfg is the file to be used when generating the formats to load hyphenation patterns.

The babel installer extends docstrip with a few “pseudo-guards” to set “variables” used at installation time. They are used with `<@name@>` at the appropriated places in the source code and shown below with `<<name>>`. That brings a little bit of literate programming.

2 locale directory

A required component of babel is a set of ini files with basic definitions for about 200 languages. They are distributed as a separate zip file, not packed as dtx. With them, babel will fully support Unicode engines.

Most of them are essentially finished (except bugs and mistakes, of course). Some of them are still incomplete (but they will be usable), and there are some omissions (eg, Latin and polytonic Greek, and there are no geographic areas in Spanish). Hindi, French, Occitan and Breton will show a warning related to dates. Not all include LICR variants.

This is a preliminary documentation.

ini files contain the actual data; tex files are currently just proxies to the corresponding ini files. Most keys are self-explanatory.

charset the encoding used in the ini file.

version of the ini file

level “version” of the ini specification . which keys are available (they may grow in a compatible way) and how they should be read.

encodings a descriptive list of font encodings.

[captions] section of captions in the file charset

[captions.licr] same, but in pure ASCII using the LICR

date.long fields are as in the CLDR, but the syntax is different. Anything inside brackets is a date field (eg, MMMM for the month name) and anything outside is text. In addition, [] is a non breakable space and [.] is an abbreviation dot.

Keys may be further qualified in a particular language with a suffix starting with an uppercase letter. It can be just a letter (eg, babel.name.A, babel.name.B) or a name (eg, date.long.Nominative, date.long.Formal, but no language is currently using the latter). *Multi-letter* qualifiers are forward compatible in the sense they won’t conflict with new “global” keys (which start always with a lowercase case). There is an exception, however: the section counters has been devised to have arbitrary keys, so you can add lowercased keys if you want.

3 Tools

```
1 <<version=3.88.12140>>
```

```
2 <<date=2023/05/01>>
```

Do not use the following macros in ldf files. They may change in the future. This applies mainly to those recently added for replacing, trimming and looping. The older ones, like `\bbl@afterfi`, will not change.

We define some basic macros which just make the code cleaner. `\bbl@add` is now used internally instead of `\addto` because of the unpredictable behavior of the latter. Used in `babel.def` and in `babel.sty`, which means in \TeX is executed twice, but we need them when defining options and `babel.def` cannot be load until options have been defined. This does not hurt, but should be fixed somehow.

```

4 \bbl@trace{Basic macros}
5 \def\bbl@stripslash{\expandafter\@gobble\string}
6 \def\bbl@add#1#2{%
7   \bbl@ifunset{\bbl@stripslash#1}%
8     {\def#1{#2}}%
9     {\expandafter\def\expandafter#1\expandafter{#1#2}}
10 \def\bbl@xin@{\@expandtwoargs\in@}
11 \def\bbl@carg#1#2{\expandafter#1\csname#2\endcsname}%
12 \def\bbl@ncarg#1#2#3{\expandafter#1\expandafter#2\csname#3\endcsname}%
13 \def\bbl@ccarg#1#2#3{%
14   \expandafter#1\csname#2\expandafter\endcsname\csname#3\endcsname}%
15 \def\bbl@csarg#1#2{\expandafter#1\csname bbl@#2\endcsname}%
16 \def\bbl@cs#1{\csname bbl@#1\endcsname}
17 \def\bbl@c1#1{\csname bbl@#1@language\endcsname}
18 \def\bbl@loop#1#2#3{\bbl@loop#1{#3}#2,\@nnil,}
19 \def\bbl@loopx#1#2{\expandafter\bbl@loop\expandafter#1\expandafter{#2}}
20 \def\bbl@loop#1#2#3,{%
21   \ifx\@nnil#3\relax\else
22     \def#1{#3}#2\bbl@afterfi\bbl@loop#1{#2}%
23   \fi}
24 \def\bbl@for#1#2#3{\bbl@loopx#1{#2}{\ifx#1\@empty\else#3\fi}}

```

`\bbl@add@list` This internal macro adds its second argument to a comma separated list in its first argument. When the list is not defined yet (or empty), it will be initiated. It presumes expandable character strings.

```

25 \def\bbl@add@list#1#2{%
26   \edef#1{%
27     \bbl@ifunset{\bbl@stripslash#1}%
28       {}%
29       {\ifx#1\@empty\else#1,\fi}%
30     #2}}

```

`\bbl@afterelse` Because the code that is used in the handling of active characters may need to look ahead, we take extra care to ‘throw’ it over the `\else` and `\fi` parts of an `\if`-statement¹. These macros will break if another `\if... \fi` statement appears in one of the arguments and it is not enclosed in braces.

```

31 \long\def\bbl@afterelse#1\else#2\fi{\fi#1}
32 \long\def\bbl@afterfi#1\fi{\fi#1}

```

`\bbl@exp` Now, just syntactical sugar, but it makes partial expansion of some code a lot more simple and readable. Here `\` stands for `\noexpand`, `\<.>` for `\noexpand` applied to a built macro name (which does not define the macro if undefined to `\relax`, because it is created locally), and `\[...]` for one-level expansion (where `...` is the macro name without the backslash). The result may be followed by extra arguments, if necessary.

```

33 \def\bbl@exp#1{%
34   \begingroup
35     \let\<\noexpand
36     \let\<\bbl@exp@en
37     \let\[\bbl@exp@ue
38     \edef\bbl@exp@aux{\endgroup#1}%
39   \bbl@exp@aux}
40 \def\bbl@exp@en#1>{\expandafter\noexpand\csname#1\endcsname}%
41 \def\bbl@exp@ue#1]{%
42   \unexpanded\expandafter\expandafter\expandafter{\csname#1\endcsname}}%

```

`\bbl@trim` The following piece of code is stolen (with some changes) from `keyval`, by David Carlisle. It defines two macros: `\bbl@trim` and `\bbl@trim@def`. The first one strips the leading and trailing spaces from

¹This code is based on code presented in TUGboat vol. 12, no2, June 1991 in “An expansion Power Lemma” by Sonja Maus.

the second argument and then applies the first argument (a macro, \toks@ and the like). The second one, as its name suggests, defines the first argument as the stripped second argument.

```

43 \def\bbl@tempa#1{%
44   \long\def\bbl@trim##1##2{%
45     \futurelet\bbl@trim@a\bbl@trim@c##2\@nil\@nil#1\@nil\relax{##1}}%
46   \def\bbl@trim@c{%
47     \ifx\bbl@trim@a\@sptoken
48       \expandafter\bbl@trim@b
49     \else
50       \expandafter\bbl@trim@b\expandafter#1%
51     \fi}%
52   \long\def\bbl@trim@b#1##1 \@nil{\bbl@trim@i##1}}
53 \bbl@tempa{ }
54 \long\def\bbl@trim@i#1\@nil#2\relax#3{#3{#1}}
55 \long\def\bbl@trim@def#1{\bbl@trim{\def#1}}

```

\bbl@ifunset To check if a macro is defined, we create a new macro, which does the same as \ifundefined. However, in an ϵ -tex engine, it is based on \ifcsname, which is more efficient, and does not waste memory. Defined inside a group, to avoid \ifcsname being implicitly set to \relax by the \csname test.

```

56 \begingroup
57   \gdef\bbl@ifunset#1{%
58     \expandafter\ifx\csname#1\endcsname\relax
59       \expandafter\@firstoftwo
60     \else
61       \expandafter\@secondoftwo
62     \fi}
63 \bbl@ifunset{ifcsname}%
64 {}%
65 {\gdef\bbl@ifunset#1{%
66   \ifcsname#1\endcsname
67     \expandafter\ifx\csname#1\endcsname\relax
68       \bbl@afterelse\expandafter\@firstoftwo
69     \else
70       \bbl@afterfi\expandafter\@secondoftwo
71     \fi
72   \else
73     \expandafter\@firstoftwo
74   \fi}}
75 \endgroup

```

\bbl@ifblank A tool from url, by Donald Arseneau, which tests if a string is empty or space. The companion macros tests if a macro is defined with some ‘real’ value, ie, not \relax and not empty,

```

76 \def\bbl@ifblank#1{%
77   \bbl@ifblank@i#1\@nil\@nil\@secondoftwo\@firstoftwo\@nil}
78 \long\def\bbl@ifblank@i#1#2\@nil#3#4#5\@nil{#4}
79 \def\bbl@ifset#1#2#3{%
80   \bbl@ifunset{#1}{#3}{\bbl@exp{\bbl@ifblank{\@nameuse{#1}}}{#3}{#2}}}

```

For each element in the comma separated <key>=<value> list, execute <code> with #1 and #2 as the key and the value of current item (trimmed). In addition, the item is passed verbatim as #3. With the <key> alone, it passes \@empty (ie, the macro thus named, not an empty argument, which is what you get with <key>= and no value).

```

81 \def\bbl@forkv#1#2{%
82   \def\bbl@kvcmd##1##2##3{#2}%
83   \bbl@kvnext#1,\@nil,}
84 \def\bbl@kvnext#1,{%
85   \ifx\@nil#1\relax\else
86     \bbl@ifblank{#1}{\bbl@forkv@eq#1=\@empty=\@nil{#1}}%
87     \expandafter\bbl@kvnext
88   \fi}
89 \def\bbl@forkv@eq#1=#2=#3\@nil#4{%

```

```

90 \bbl@trim@def\bbl@forkv@a{#1}%
91 \bbl@trim{\expandafter\bbl@kvcmd\expandafter{\bbl@forkv@a}}{#2}{#4}}

```

A *for* loop. Each item (trimmed), is #1. It cannot be nested (it's doable, but we don't need it).

```

92 \def\bbl@vforeach#1#2{%
93 \def\bbl@forcmd##1{#2}%
94 \bbl@fornext#1,\@nil,}
95 \def\bbl@fornext#1,{%
96 \ifx\@nil#1\relax\else
97 \bbl@ifblank{#1}{\bbl@trim\bbl@forcmd{#1}}%
98 \expandafter\bbl@fornext
99 \fi}
100 \def\bbl@foreach#1{\expandafter\bbl@vforeach\expandafter{#1}}

```

\bbl@replace Returns implicitly \toks@ with the modified string.

```

101 \def\bbl@replace#1#2#3{% in #1 -> repl #2 by #3
102 \toks@{}}%
103 \def\bbl@replace@aux##1#2##2#2{%
104 \ifx\bbl@nil##2%
105 \toks@\expandafter{\the\toks@##1}%
106 \else
107 \toks@\expandafter{\the\toks@##1#3}%
108 \bbl@afterfi
109 \bbl@replace@aux##2#2%
110 \fi}%
111 \expandafter\bbl@replace@aux#1#2\bbl@nil#2%
112 \edef#1{\the\toks@}}

```

An extension to the previous macro. It takes into account the parameters, and it is string based (ie, if you replace elax by ho, then \relax becomes \rho). No checking is done at all, because it is not a general purpose macro, and it is used by babel only when it works (an example where it does *not* work is in \bbl@TG@@date, and also fails if there are macros with spaces, because they are retokenized). It may change! (or even merged with \bbl@replace; I'm not sure ckecking the replacement is really necessary or just paranoia).

```

113 \ifx\detokenize\undefined\else % Unused macros if old Plain TeX
114 \bbl@exp{\def\\bbl@parsedef##1\detokenize{macro:}}{#2->#3\relax}%
115 \def\bbl@tempa{#1}%
116 \def\bbl@tempb{#2}%
117 \def\bbl@tempe{#3}}
118 \def\bbl@sreplace#1#2#3{%
119 \begingroup
120 \expandafter\bbl@parsedef\meaning#1\relax
121 \def\bbl@tempc{#2}%
122 \edef\bbl@tempc{\expandafter\strip@prefix\meaning\bbl@tempc}%
123 \def\bbl@tempd{#3}%
124 \edef\bbl@tempd{\expandafter\strip@prefix\meaning\bbl@tempd}%
125 \bbl@xin@{\bbl@tempc}{\bbl@tempe}% If not in macro, do nothing
126 \ifin@
127 \bbl@exp{\\bbl@replace\\bbl@tempe{\bbl@tempc}{\bbl@tempd}}%
128 \def\bbl@tempc{% Expanded an executed below as 'uplevel'
129 \\\makeatletter % "internal" macros with @ are assumed
130 \\\scantokens{%

132 \catcode64=\the\catcode64\relax}% Restore @
133 \else
134 \let\bbl@tempc\@empty % Not \relax
135 \fi
136 \bbl@exp{% For the 'uplevel' assignments
137 \endgroup
138 \bbl@tempc}} % empty or expand to set #1 with changes
139 \fi

```

Two further tools. `\bbl@ifsamestring` first expand its arguments and then compare their expansion (sanitized, so that the catcodes do not matter). `\bbl@engine` takes the following values: 0 is pdf_T_EX, 1 is luatex, and 2 is xetex. You may use the latter it in your language style if you want.

```

140 \def\bbl@ifsamestring#1#2{%
141   \begingroup
142     \protected@edef\bbl@tempb{#1}%
143     \edef\bbl@tempb{\expandafter\strip@prefix\meaning\bbl@tempb}%
144     \protected@edef\bbl@tempc{#2}%
145     \edef\bbl@tempc{\expandafter\strip@prefix\meaning\bbl@tempc}%
146     \ifx\bbl@tempb\bbl@tempc
147       \aftergroup\@firstoftwo
148     \else
149       \aftergroup\@secondoftwo
150     \fi
151   \endgroup}
152 \chardef\bbl@engine=%
153 \ifx\directlua\@undefined
154   \ifx\XeTeXinputencoding\@undefined
155     \z@
156   \else
157     \tw@
158   \fi
159 \else
160   \@ne
161 \fi

```

A somewhat hackish tool (hence its name) to avoid spurious spaces in some contexts.

```

162 \def\bbl@bsphack{%
163   \ifhmode
164     \hskip\z@skip
165     \def\bbl@esphack{\loop\ifdim\lastskip>\z@\unskip\repeat\unskip}%
166   \else
167     \let\bbl@esphack\@empty
168   \fi}

```

Another hackish tool, to apply case changes inside a protected macros. It's based on the internal `\let`'s made by `\MakeUppercase` and `\MakeLowercase` between things like `\oe` and `\OE`.

```

169 \def\bbl@cased{%
170   \ifx\oe\OE
171     \expandafter\in@\expandafter
172       {\expandafter\OE\expandafter}\expandafter{\oe}%
173     \ifin@
174       \bbl@afterelse\expandafter\MakeUppercase
175     \else
176       \bbl@afterfi\expandafter\MakeLowercase
177     \fi
178   \else
179     \expandafter\@firstofone
180   \fi}

```

The following adds some code to `\extras...` both before and after, while avoiding doing it twice. It's somewhat convoluted, to deal with `#`'s. Used to deal with `alph`, `Alph` and `frenchspacing` when there are already changes (with `\babel@save`).

```

181 \def\bbl@extras@wrap#1#2#3{% 1:in-test, 2:before, 3:after
182   \toks@\expandafter\expandafter\expandafter{%
183     \csname extras\language\endcsname}%
184   \bbl@exp{\in@{#1}}{\the\toks@}}%
185   \ifin@\else
186     \@temptokena{#2}%
187     \edef\bbl@tempc{\the\@temptokena\the\toks@}%
188     \toks@\expandafter{\bbl@tempc#3}%
189     \expandafter\edef\csname extras\language\endcsname{\the\toks@}%
190   \fi}
191 <</Basic macros>>

```

Some files identify themselves with a \LaTeX macro. The following code is placed before them to define (and then undefine) if not in \LaTeX .

```
192 <<*Make sure ProvidesFile is defined>> ≡
193 \ifx\ProvidesFile\@undefined
194   \def\ProvidesFile#1[#2 #3 #4]{%
195     \wlog{File: #1 #4 #3 <#2>}%
196     \let\ProvidesFile\@undefined}
197 \fi
198 <</Make sure ProvidesFile is defined>>
```

3.1 Multiple languages

`\language` Plain \TeX version 3.0 provides the primitive `\language` that is used to store the current language. When used with a pre-3.0 version this function has to be implemented by allocating a counter. The following block is used in `switch.def` and `hyphen.cfg`; the latter may seem redundant, but remember `babel` doesn't require loading `switch.def` in the format.

```
199 <<*Define core switching macros>> ≡
200 \ifx\language\@undefined
201   \csname newcount\endcsname\language
202 \fi
203 <</Define core switching macros>>
```

`\last@language` Another counter is used to keep track of the allocated languages. \TeX and \LaTeX reserves for this purpose the count 19.

`\addlanguage` This macro was introduced for $\TeX < 2$. Preserved for compatibility.

```
204 <<*Define core switching macros>> ≡
205 \countdef\last@language=19
206 \def\addlanguage{\csname newlanguage\endcsname}
207 <</Define core switching macros>>
```

Now we make sure all required files are loaded. When the command `\AtBeginDocument` doesn't exist we assume that we are dealing with a plain-based format. In that case the file `plain.def` is needed (which also defines `\AtBeginDocument`, and therefore it is not loaded twice). We need the first part when the format is created, and `\orig@dump` is used as a flag. Otherwise, we need to use the second part, so `\orig@dump` is not defined (`plain.def` undefines it). Check if the current version of `switch.def` has been previously loaded (mainly, `hyphen.cfg`). If not, load it now. We cannot load `babel.def` here because we first need to declare and process the package options.

3.2 The Package File (\LaTeX , `babel.sty`)

```
208 <*package>
209 \NeedsTeXFormat{LaTeX2e}[2005/12/01]
210 \ProvidesPackage{babel}[\<date>] v\<version> The Babel package]
```

Start with some “private” debugging tool, and then define macros for errors.

```
211 \@ifpackagewith{babel}{debug}
212   {\providecommand\bbl@trace[1]{\message{^^J[ #1 ]}}%
213     \let\bbl@debug\@firstofone
214     \ifx\directlua\@undefined\else
215       \directlua{ Babel = Babel or {}
216         Babel.debug = true }%
217       \input{babel-debug.tex}%
218     \fi}
219 {\providecommand\bbl@trace[1]{}%
220   \let\bbl@debug\@gobble
221   \ifx\directlua\@undefined\else
222     \directlua{ Babel = Babel or {}
223       Babel.debug = false }%
224   \fi}
225 \def\bbl@error#1#2{%
226   \begingroup
```

```

227 \def\{\MessageBreak}%
228 \PackageError{babel}{#1}{#2}%
229 \endgroup}
230 \def\bbl@warning#1{%
231 \begingroup
232 \def\{\MessageBreak}%
233 \PackageWarning{babel}{#1}%
234 \endgroup}
235 \def\bbl@infowarn#1{%
236 \begingroup
237 \def\{\MessageBreak}%
238 \PackageNote{babel}{#1}%
239 \endgroup}
240 \def\bbl@info#1{%
241 \begingroup
242 \def\{\MessageBreak}%
243 \PackageInfo{babel}{#1}%
244 \endgroup}

```

This file also takes care of a number of compatibility issues with other packages and defines a few additional package options. Apart from all the language options below we also have a few options that influence the behavior of language definition files.

Many of the following options don't do anything themselves, they are just defined in order to make it possible for babel and language definition files to check if one of them was specified by the user.

But first, include here the *Basic macros* defined above.

```

245 <Basic macros>
246 \@ifpackagewith{babel}{silent}
247 {\let\bbl@info@gobble
248 \let\bbl@infowarn@gobble
249 \let\bbl@warning@gobble}
250 {}

3.3 base

The first 'real' option to be processed is base, which sets the hyphenation patterns then resets `ver@babel.sty` so that \TeX forgets about the first loading. After a subset of `babel.def` has been loaded (the old `switch.def`) and `\AfterBabelLanguage` defined, it exits.

Now the base option. With it we can define (and load, with `luatex`) hyphenation patterns, even if we are not interested in the rest of babel.

```

272 \bbl@trace{Defining option 'base'}
273 \@ifpackagewith{babel}{base}{%

```

```

291 \endinput}{}%

```

3.4 key=value options and other general option

The following macros extract language modifiers, and only real package options are kept in the option list. Modifiers are saved and assigned to `\BabelModifiers` at `\bbl@load@language`; when no modifiers have been given, the former is `\relax`. How modifiers are handled are left to language styles; they can use `\in@`, loop them with `\@for` or `load keyval`, for example.

```

292 \bbl@trace{key=value and another general options}
293 \bbl@csarg\let{tempa\expandafter}\csname opt@babel.sty\endcsname
294 \def\bbl@tempb#1.#2{% Remove trailing dot
295   #1\ifx\@empty#2\else,\bbl@afterfi\bbl@tempb#2\fi}%
296 \def\bbl@tempd#1.#2\@nnil{% TODO. Refactor lists?
297   \ifx\@empty#2%

310         \bbl@csarg\edef{mod@#1}{\bbl@tempb#2}%
311       \fi
312     \fi
313   \fi}
314 \let\bbl@tempc\@empty
315 \bbl@foreach\bbl@tempa{\bbl@tempd#1.\@empty\@nnil}
316 \expandafter\let\csname opt@babel.sty\endcsname\bbl@tempc

```

The next option tells babel to leave shorthand characters active at the end of processing the package. This is *not* the default as it can cause problems with other packages, but for those who want to use the shorthand characters in the preamble of their documents this can help.

```

317 \DeclareOption{KeepShorthandsActive}{}
318 \DeclareOption{activeacute}{}
319 \DeclareOption{activegrave}{}
320 \DeclareOption{debug}{}
321 \DeclareOption{noconfigs}{}
322 \DeclareOption{showlanguages}{}
323 \DeclareOption{silent}{}
324 % \DeclareOption{mono}{}
325 \DeclareOption{shorthands=off}{\bbl@tempa shorthands=\bbl@tempa}

```

```

326 \chardef\bbl@iniflag\z@
327 \DeclareOption{provide=*}{\chardef\bbl@iniflag@ne} % main -> +1
328 \DeclareOption{provide+=*}{\chardef\bbl@iniflag\tw@} % add = 2
329 \DeclareOption{provide*=*}{\chardef\bbl@iniflag\thr@@} % add + main
330 % A separate option
331 \let\bbl@autoload@options\@empty
332 \DeclareOption{provide@=*}{\def\bbl@autoload@options{import}}
333 % Don't use. Experimental. TODO.
334 \newif\ifbbl@single
335 \DeclareOption{selectors=off}{\bbl@singletrue}
336 <More package options>

```

Handling of package options is done in three passes. (I [JBL] am not very happy with the idea, anyway.) The first one processes options which has been declared above or follow the syntax <key>=<value>, the second one loads the requested languages, except the main one if set with the key main, and the third one loads the latter. First, we “flag” valid keys with a nil value.

```

337 \let\bbl@opt@shorthands\@nnil
338 \let\bbl@opt@config\@nnil
339 \let\bbl@opt@main\@nnil
340 \let\bbl@opt@headfoot\@nnil
341 \let\bbl@opt@layout\@nnil
342 \let\bbl@opt@provide\@nnil

```

The following tool is defined temporarily to store the values of options.

```

343 \def\bbl@tempa#1=#2\bbl@tempa{%
344   \bbl@csarg\ifx{opt@#1}\@nnil
345     \bbl@csarg\edef{opt@#1}{#2}%
346   \else
347     \bbl@error
348     {Bad option '#1=#2'. Either you have misspelled the\\
349     key or there is a previous setting of '#1'. Valid\\
350     keys are, among others, 'shorthands', 'main', 'bidi',\\
351     'strings', 'config', 'headfoot', 'safe', 'math'.}%
352     {See the manual for further details.}
353   \fi}

```

Now the option list is processed, taking into account only currently declared options (including those declared with a =), and <key>=<value> options (the former take precedence). Unrecognized options are saved in \bbl@language@opts, because they are language options.

```

354 \let\bbl@language@opts\@empty
355 \DeclareOption*{%
356   \bbl@xin@{\string=}{\CurrentOption}%
357   \ifin@
358     \expandafter\bbl@tempa\CurrentOption\bbl@tempa
359   \else
360     \bbl@add@list\bbl@language@opts{\CurrentOption}%
361   \fi}

```

Now we finish the first pass (and start over).

```

362 \ProcessOptions*
363 \ifx\bbl@opt@provide\@nnil
364   \let\bbl@opt@provide\@empty %%% MOVE above
365 \else

372   \fi}
373 \fi
374 %

```

3.5 Conditional loading of shorthands

If there is no shorthands=<chars>, the original babel macros are left untouched, but if there is, these macros are wrapped (in babel.def) to define only those given.

A bit of optimization: if there is no shorthands=, then \bbl@ifshorthand is always true, and it is always false if shorthands is empty. Also, some code makes sense only with shorthands=...

```
375 \bbl@trace{Conditional loading of shorthands}
376 \def\bbl@sh@string#1{%
377   \ifx#1\@empty\else
378     \ifx#1t\string~%
379     \else\ifx#1c\string,%
380     \else\string#1%
381     \fi\fi
382     \expandafter\bbl@sh@string
383   \fi}
384 \ifx\bbl@opt@shorthands\@nnil
385   \def\bbl@ifshorthand#1#2#3{#2}%
386 \else\ifx\bbl@opt@shorthands\@empty
387   \def\bbl@ifshorthand#1#2#3{#3}%
388 \else
```

The following macro tests if a shorthand is one of the allowed ones.

```
389   \def\bbl@ifshorthand#1{%
390     \bbl@xin@{\string#1}{\bbl@opt@shorthands}%
391     \ifin@
392       \expandafter\@firstoftwo
393     \else
394       \expandafter\@secondoftwo
395     \fi}
```

We make sure all chars in the string are ‘other’, with the help of an auxiliary macro defined above (which also zaps spaces).

```
396   \edef\bbl@opt@shorthands{%
397     \expandafter\bbl@sh@string\bbl@opt@shorthands\@empty}%
```

The following is ignored with shorthands=off, since it is intended to take some additional actions for certain chars.

```
398   \bbl@ifshorthand{'}%
399     {\PassOptionsToPackage{activeacute}{babel}}{}
400   \bbl@ifshorthand{`}%
401     {\PassOptionsToPackage{activegrave}{babel}}{}
402 \fi\fi
```

With headfoot=lang we can set the language used in heads/foots. For example, in babel/3796 just adds headfoot=english. It misuses \@resetactivechars but seems to work.

```
403 \ifx\bbl@opt@headfoot\@nnil\else
404   \g@addto@macro\@resetactivechars{%
405     \set@typeset@protect
406     \expandafter\select@language@x\expandafter{\bbl@opt@headfoot}%
407     \let\protect\noexpand}
408 \fi
```

For the option safe we use a different approach – \bbl@opt@safe says which macros are redefined (B for bibs and R for refs). By default, both are currently set, but in a future release it will be set to none.

```
409 \ifx\bbl@opt@safe\@undefined
410   \def\bbl@opt@safe{BR}
411   % \let\bbl@opt@safe\@empty % Pending of \cite
412 \fi
```

For layout an auxiliary macro is provided, available for packages and language styles. Optimization: if there is no layout, just do nothing.

```
413 \bbl@trace{Defining IfBabelLayout}

427   \else
428     \expandafter\@secondoftwo
429   \fi}
430 \fi
431 \</package>
432 \<*core>

```

3.6 Interlude for Plain

Because of the way docstrip works, we need to insert some code for Plain here. However, the tools provided by the babel installer for literate programming makes this section a short interlude, because the actual code is below, tagged as *Emulate LaTeX*.

```

433 \ifx\ldf@quit\@undefined\else
434 \endinput\fi % Same line!
435 \<Make sure ProvidesFile is defined>
436 \ProvidesFile{babel.def}[\<date>] v[\<version>] Babel common definitions]
437 \ifx\AtBeginDocument\@undefined % TODO. change test.
438   \<Emulate LaTeX>
439 \fi

```

That is all for the moment. Now follows some common stuff, for both Plain and \LaTeX . After it, we will resume the \LaTeX -only stuff.

```

440 \</core>
441 \<*package | core>

```

4 Multiple languages

This is not a separate file (switch.def) anymore.

Plain \TeX version 3.0 provides the primitive `\language` that is used to store the current language. When used with a pre-3.0 version this function has to be implemented by allocating a counter.

```

442 \def\bbl@version{\<version>}
443 \def\bbl@date{\<date>}
444 \<Define core switching macros>

```

`\adddialect` The macro `\adddialect` can be used to add the name of a dialect or variant language, for which an already defined hyphenation table can be used.

```

445 \def\adddialect#1#2{%
446   \global\chardef#1#2\relax
447   \bbl@usehooks{adddialect}{#1}{#2}%
448   \begingroup
449     \count@#1\relax
450     \def\bbl@elt##1##2##3##4{%

453         \bbl@info{Hyphen rules for '\expandafter\@gobble\bbl@tempa'
454           set to \expandafter\string\csname l@##1\endcsname\%
455           (\string\language\the\count@). Reported}%
456       \def\bbl@elt####1####2####3####4{%
457         \fi}%
458       \bbl@cs{languages}%
459     \endgroup}

```

`\bbl@iflanguage` executes code only if the language `l@` exists. Otherwise raises an error. The argument of `\bbl@fixname` has to be a macro name, as it may get “fixed” if casing (lc/uc) is wrong. It’s an attempt to fix a long-standing bug when `\foreignlanguage` and the like appear in a `\MakeXXXcase`. However, a lowercase form is not imposed to improve backward compatibility (perhaps you defined a language named MYLANG, but unfortunately mixed case names cannot be trapped). Note `l@` is encapsulated, so that its case does not change.

```

460 \def\bbl@fixname#1{%
461   \begingroup
462   \def\bbl@tempe{l}%

476 \def\bbl@iflanguage#1{%
477   \@ifundefined{l@#1}{\@nolanerr{#1}\@gobble}\@firstofone}

```

After a name has been ‘fixed’, the selectors will try to load the language. If even the fixed name is not defined, will load it on the fly, either based on its name, or if activated, its BCP47 code.

We first need a couple of macros for a simple BCP 47 look up. It also makes sure, with `\bbl@bcpcase`, casing is the correct one, so that `sr-latn-ba` becomes `fr-Latn-BA`. Note #4 may contain some `\empty`’s, but they are eventually removed. `\bbl@bcpllookup` either returns the found ini or it is `\relax`.

```

550    \fi}

```

`\iflanguage` Users might want to test (in a private package for instance) which language is currently active. For this we provide a test macro, `\iflanguage`, that has three arguments. It checks whether the first argument is a known language. If so, it compares the first argument with the value of `\language`. Then, depending on the result of the comparison, it executes either the second or the third argument.

```

551 \def\iflanguage#1{%
552   \bbl@iflanguage{#1}%
553   \ifnum\csname l@#1\endcsname=\language
554     \expandafter\@firstoftwo
555   \else
556     \expandafter\@secondoftwo
557   \fi}

```

4.1 Selecting the language

`\selectlanguage` The macro `\selectlanguage` checks whether the language is already defined before it performs its actual task, which is to update `\language` and activate language-specific definitions.

```

558 \let\bbl@select@type\z@
559 \edef\selectlanguage{%
560   \noexpand\protect
561   \expandafter\noexpand\csname selectlanguage \endcsname}

```

Because the command `\selectlanguage` could be used in a moving argument it expands to `\protect\selectlanguage`. Therefore, we have to make sure that a macro `\protect` exists. If it doesn't it is `\let` to `\relax`.

```
562 \ifx\@undefined\protect\let\protect\relax\fi
```

The following definition is preserved for backwards compatibility (eg, arabi, koma). It is related to a trick for 2.09, now discarded.

```
563 \let\xstring\string
```

Since version 3.5 babel writes entries to the auxiliary files in order to typeset table of contents etc. in the correct language environment.

`\bbl@pop@language` But when the language change happens *inside* a group the end of the group doesn't write anything to the auxiliary files. Therefore we need TeX's `aftergroup` mechanism to help us. The command `\aftergroup` stores the token immediately following it to be executed when the current group is closed. So we define a temporary control sequence `\bbl@pop@language` to be executed at the end of the group. It calls `\bbl@set@language` with the name of the current language as its argument.

`\bbl@language@stack` The previous solution works for one level of nesting groups, but as soon as more levels are used it is no longer adequate. For that case we need to keep track of the nested languages using a stack mechanism. This stack is called `\bbl@language@stack` and initially empty.

```
564 \def\bbl@language@stack{}
```

When using a stack we need a mechanism to push an element on the stack and to retrieve the information afterwards.

`\bbl@push@language` The stack is simply a list of languagenames, separated with a '+' sign; the push function can be simple:
`\bbl@pop@language`

```
565 \def\bbl@push@language{%
566   \ifx\language\@undefined\else
567     \ifx\currentgrouplevel\@undefined
568       \xdef\bbl@language@stack{\language+\bbl@language@stack}%
569     \else
570       \ifnum\currentgrouplevel=\z@
571         \xdef\bbl@language@stack{\language+}%
572       \else
573         \xdef\bbl@language@stack{\language+\bbl@language@stack}%
574       \fi
575     \fi
576   \fi}
```

Retrieving information from the stack is a little bit less simple, as we need to remove the element from the stack while storing it in the macro `\language`. For this we first define a helper function.

`\bbl@pop@lang` This macro stores its first element (which is delimited by the '+'-sign) in `\language` and stores the rest of the string in `\bbl@language@stack`.

```
577 \def\bbl@pop@lang#1+#2\@{%
578   \edef\language{#1}%
579   \xdef\bbl@language@stack{#2}}
```

The reason for the somewhat weird arrangement of arguments to the helper function is the fact it is called in the following way. This means that before `\bbl@pop@lang` is executed TeX first *expands* the stack, stored in `\bbl@language@stack`. The result of that is that the argument string of `\bbl@pop@lang` contains one or more language names, each followed by a '+'-sign (zero language names won't occur as this macro will only be called after something has been pushed on the stack).

```
580 \let\bbl@ifrestoring\@secondoftwo
581 \def\bbl@pop@language{%
582   \expandafter\bbl@pop@lang\bbl@language@stack\@
583   \let\bbl@ifrestoring\@firstoftwo
584   \expandafter\bbl@set@language\expandafter{\language}%
585   \let\bbl@ifrestoring\@secondoftwo}
```

Once the name of the previous language is retrieved from the stack, it is fed to `\bbl@set@language` to do the actual work of switching everything that needs switching.

An alternative way to identify languages (in the babel sense) with a numerical value is introduced in 3.30. This is one of the first steps for a new interface based on the concept of locale, which explains the name of `\localeid`. This means `\l@...` will be reserved for hyphenation patterns (so that two locales can share the same rules).

```

586 \chardef\localeid\z@
587 \def\bbl@id@last{0} % No real need for a new counter
588 \def\bbl@id@assign{%
589   \bbl@ifunset{\bbl@id@\language}%
590   {\count@\bbl@id@last\relax

594    \ifcase\bbl@engine\or
595      \directlua{
596        Babel = Babel or {}
597        Babel.locale_props = Babel.locale_props or {}
598        Babel.locale_props[\bbl@id@last] = {}
599        Babel.locale_props[\bbl@id@last].name = '\language'
600      }%
601    \fi}%
602  }%
603  \chardef\localeid\bbl@cl{id@}}

```

The unprotected part of `\selectlanguage`.

```

604 \expandafter\def\csname selectlanguage \endcsname#1{%
605   \ifnum\bbl@hymapset=\@cclv\let\bbl@hymapset\tw\fi
606   \bbl@push@language
607   \aftergroup\bbl@pop@language
608   \bbl@set@language{#1}}

```

`\bbl@set@language` The macro `\bbl@set@language` takes care of switching the language environment *and* of writing entries on the auxiliary files. For historical reasons, language names can be either language of `\language`. To catch either form a trick is used, but unfortunately as a side effect the catcodes of letters in `\language` are messed up. This is a bug, but preserved for backwards compatibility. The list of auxiliary files can be extended by redefining `\BabelContentsFiles`, but make sure they are loaded inside a group (as `aux`, `toc`, `lof`, and `lot` do) or the last language of the document will remain active afterwards.

We also write a command to change the current language in the auxiliary files.

`\bbl@savelastskip` is used to deal with skips before the write whatsit (as suggested by U Fischer). Adapted from `hyperref`, but it might fail, so I'll consider it a temporary hack, while I study other options (the ideal, but very likely unfeasible except perhaps in `luatex`, is to avoid the `\write` altogether when not needed).

```

```

First, check if the user asks for a known language. If so, update the value of `\language` and call `\originalTeX` to bring \TeX in a certain pre-defined state.

The name of the language is stored in the control sequence `\language`.

Then we have to *redefine* `\originalTeX` to compensate for the things that have been activated. To save memory space for the macro definition of `\originalTeX`, we construct the control sequence name for the `\noextras<lang>` command at definition time by expanding the `\csname` primitive. Now activate the language-specific definitions. This is done by constructing the names of three macros by concatenating three words with the argument of `\selectlanguage`, and calling these macros.

The switching of the values of `\lefthyphenmin` and `\righthyphenmin` is somewhat different. First we save their current values, then we check if `\<lang>hyphenmins` is defined. If it is not, we set default values (2 and 3), otherwise the values in `\<lang>hyphenmins` will be used.

`otherlanguage (env.)` The `otherlanguage` environment can be used as an alternative to using the `\selectlanguage` declarative command. When you are typesetting a document which mixes left-to-right and right-to-left typesetting you have to use this environment in order to let things work as you expect them to.

The `\ignorespaces` command is necessary to hide the environment when it is entered in horizontal mode.

```

762 \long\def\otherlanguage#1{%
763 \def\bbl@selectorname{other}%
764 \ifnum\bbl@hymapsel=\@cclv\let\bbl@hymapsel\thr@@\fi
765 \csname selectlanguage\endcsname{#1}%
766 \ignorespaces}

```

The `\endotherlanguage` part of the environment tries to hide itself when it is called in horizontal mode.

```

767 \long\def\endotherlanguage{%
768 \global\@ignoretrue\ignorespaces}

```

`otherlanguage* (env.)` The `otherlanguage` environment is meant to be used when a large part of text from a different language needs to be typeset, but without changing the translation of words such as ‘figure’. This environment makes use of `\foreign@language`.

```

769 \expandafter\def\csname otherlanguage*\endcsname{%
770 \@ifnextchar[\bbl@otherlanguage@s{\bbl@otherlanguage@s[]}}
771 \def\bbl@otherlanguage@s[#1]#2{%
772 \def\bbl@selectorname{other*}%
773 \ifnum\bbl@hymapsel=\@cclv\chardef\bbl@hymapsel4\relax\fi
774 \def\bbl@select@opts{#1}%
775 \foreign@language{#2}}

```

At the end of the environment we need to switch off the extra definitions. The grouping mechanism of the environment will take care of resetting the correct hyphenation rules and “extras”.

```

776 \expandafter\let\csname endotherlanguage*\endcsname\relax

```

`\foreignlanguage` The `\foreignlanguage` command is another substitute for the `\selectlanguage` command. This command takes two arguments, the first argument is the name of the language to use for typesetting the text specified in the second argument.

Unlike `\selectlanguage` this command doesn’t switch *everything*, it only switches the hyphenation rules and the extra definitions for the language specified. It does this within a group and assumes the `\extras<lang>` command doesn’t make any `\global` changes. The coding is very similar to part of `\selectlanguage`.

`\bbl@beforeforeign` is a trick to fix a bug in bidi texts. `\foreignlanguage` is supposed to be a ‘text’ command, and therefore it must emit a `\leavevmode`, but it does not, and therefore the indent is placed on the opposite margin. For backward compatibility, however, it is done only if a right-to-left script is requested; otherwise, it is no-op.

(3.11) `\foreignlanguage*` is a temporary, experimental macro for a few lines with a different script direction, while preserving the paragraph format (thank the braces around `\par`, things like `\hangindent` are not reset). Do not use it in production, because its semantics and its syntax may change (and very likely will, or even it could be removed altogether). Currently it enters in vmode and then selects the language (which in turn sets the paragraph direction).

(3.11) Also experimental are the hook `foreign` and `foreign*`. With them you can redefine `\BabelText` which by default does nothing. Its behavior is not well defined yet. So, use it in horizontal mode only if you do not want surprises.

In other words, at the beginning of a paragraph `\foreignlanguage` enters into hmode with the surrounding lang, and with `\foreignlanguage*` with the new lang.

```

864       \expandafter\expandafter\expandafter\set@hyphenmins
865       \csname\bbl@tempf hyphenmins\endcsname\relax
866     \fi}}
867 \let\endhyphenrules\@empty

```

`\providehyphenmins` The macro `\providehyphenmins` should be used in the language definition files to provide a *default* setting for the hyphenation parameters `\lefthyphenmin` and `\righthyphenmin`. If the macro `\(lang)hyphenmins` is already defined this command has no effect.

```

868 \def\providehyphenmins#1#2{%
869   \expandafter\ifx\csname #1hyphenmins\endcsname\relax
870     \@namedef{#1hyphenmins}{#2}%
871   \fi}

```

`\set@hyphenmins` This macro sets the values of `\lefthyphenmin` and `\righthyphenmin`. It expects two values as its argument.

```

872 \def\set@hyphenmins#1#2{%
873   \lefthyphenmin#1\relax
874   \righthyphenmin#2\relax}

```

`\ProvidesLanguage` The identification code for each file is something that was introduced in \LaTeX 2_ϵ . When the command `\ProvidesFile` does not exist, a dummy definition is provided temporarily. For use in the language definition file the command `\ProvidesLanguage` is defined by babel. Depending on the format, ie, on if the former is defined, we use a similar definition or not.

```

875 \ifx\ProvidesFile\@undefined
876   \def\ProvidesLanguage#1[#2 #3 #4]{%
877     \wlog{Language: #1 #4 #3 <#2>}%
878   }
879 \else
880   \def\ProvidesLanguage#1{%
881     \begingroup
882       \catcode`\ 10 %
883       \@makeother\/%
884       \@ifnextchar[%]
885         {\@provideslanguage{#1}}{\@provideslanguage{#1}[]}
886   \def\@provideslanguage#1[#2]{%
887     \wlog{Language: #1 #2}%
888     \expandafter\xdef\csname ver@#1.ldf\endcsname{#2}%
889   \endgroup}
890 \fi

```

`\originalTeX` The macro `\originalTeX` should be known to \TeX at this moment. As it has to be expandable we `\let` it to `\@empty` instead of `\relax`.

```
891 \ifx\originalTeX\@undefined\let\originalTeX\@empty\fi
```

Because this part of the code can be included in a format, we make sure that the macro which initializes the save mechanism, `\babel@beginsave`, is not considered to be undefined.

```
892 \ifx\babel@beginsave\@undefined\let\babel@beginsave\relax\fi
```

A few macro names are reserved for future releases of babel, which will use the concept of ‘locale’:

```

893 \providecommand\setlocale{%
894   \bbl@error
895   {Not yet available}%
896   {Find an armchair, sit down and wait}}
897 \let\uselocale\setlocale
898 \let\locale\setlocale
899 \let\selectlocale\setlocale
900 \let\textlocale\setlocale
901 \let\textlanguage\setlocale
902 \let\languagegetext\setlocale

```

4.2 Errors

`\@nolanerr` The babel package will signal an error when a documents tries to select a language that hasn’t been defined earlier. When a user selects a language for which no hyphenation patterns were loaded into the format he will be given a warning about that fact. We revert to the patterns for `\language=0` in that case. In most formats that will be (US)english, but it might also be empty.

`\@nopatterns`

`\@noopterr` When the package was loaded without options not everything will work as expected. An error message is issued in that case.

When the format knows about `\PackageError` it must be \LaTeX 2_ϵ , so we can safely use its error handling interface. Otherwise we’ll have to ‘keep it simple’.

Infos are not written to the console, but on the other hand many people think warnings are errors, so a further message type is defined: an important info which is sent to the console.

```

`\addto` It takes two arguments, a *<control sequence>* and \TeX -code to be added to the *<control sequence>*. If the *<control sequence>* has not been defined before it is defined now. The control sequence could also expand to `\relax`, in which case a circular definition results. The net result is a stack overflow. Note there is an inconsistency, because the assignment in the last branch is global.

```

968 \def\addto#1#2{%
969   \ifx#1\undefined
970     \def#1{#2}%
971   \else
972     \ifx#1\relax

976        \xdef#1{\the\toks@}}%
977     \fi
978   \fi}

```

The macro `\initiate@active@char` below takes all the necessary actions to make its argument a shorthand character. The real work is performed once for each character. But first we define a little tool.

```

979 \def\bbl@withactive#1#2{%
980   \begingroup
981     \lccode`~=#2\relax
982     \lowercase{\endgroup#1~}}

```

`\bbl@redefine` To redefine a command, we save the old meaning of the macro. Then we redefine it to call the original macro with the ‘sanitized’ argument. The reason why we do it this way is that we don’t want to redefine the \TeX macros completely in case their definitions change (they have changed in the past). A macro named `\macro` will be saved new control sequences named `\org@macro`.

```

983 \def\bbl@redefine#1{%
984   \edef\bbl@tempa{\bbl@stripslash#1}%
985   \expandafter\let\csname org@\bbl@tempa\endcsname#1%
986   \expandafter\def\csname\bbl@tempa\endcsname{
987     \@onlypreamble\bbl@redefine

```

`\bbl@redefine@long` This version of `\babel@redefine` can be used to redefine `\long` commands such as `\ifthenelse`.

```

988 \def\bbl@redefine@long#1{%
989   \edef\bbl@tempa{\bbl@stripslash#1}%
990   \expandafter\let\csname org@\bbl@tempa\endcsname#1%
991   \long\expandafter\def\csname\bbl@tempa\endcsname{
992     \@onlypreamble\bbl@redefine@long

```

`\bbl@redefineroobust` For commands that are redefined, but which *might* be robust we need a slightly more intelligent macro. A robust command `foo` is defined to expand to `\protect\foo_`. So it is necessary to check whether `\foo_` exists. The result is that the command that is being redefined is always robust afterwards. Therefore all we need to do now is define `\foo_`.

```

993 \def\bbl@redefineroobust#1{%
994   \edef\bbl@tempa{\bbl@stripslash#1}%
995   \bbl@ifunset{\bbl@tempa\space}%
996     {\expandafter\let\csname org@\bbl@tempa\endcsname#1%
997      \bbl@exp{\def\#1{\protect\<\bbl@tempa\space>}}}%
998     {\bbl@exp{\let\<org@\bbl@tempa>\<\bbl@tempa\space>}}}%
999     \@namedef{\bbl@tempa\space}}
1000 \@onlypreamble\bbl@redefineroobust

```

4.3 Hooks

Admittedly, the current implementation is a somewhat simplistic and does very little to catch errors, but it is meant for developers, after all. `\bbl@usehooks` is the commands used by babel to execute hooks defined for an event.

```

1001 \bbl@trace{Hooks}
1002 \newcommand\AddBabelHook[3][]{%
1003   \bbl@ifunset{bbl@hk@#2}{\EnableBabelHook{#2}}{%
1004     \def\bbl@tempa##1,#3=##2,##3\@empty{\def\bbl@tempb{##2}}%
1005     \expandafter\bbl@tempa\bbl@evargs,#3=,\@empty
1006     \bbl@ifunset{bbl@ev@#2@#3@#1}%
1007       {\bbl@csarg\bbl@add{ev@#3@#1}{\bbl@elth{#2}}}%
1008       {\bbl@csarg\let{ev@#2@#3@#1}\relax}%
1009     \bbl@csarg\newcommand{ev@#2@#3@#1}{\bbl@tempb}}
1010 \newcommand\EnableBabelHook[1]{\bbl@csarg\let{hk@#1}\@firstofone}
1011 \newcommand\DisableBabelHook[1]{\bbl@csarg\let{hk@#1}\@gobble}
1012 \def\bbl@usehooks{\bbl@usehooks@lang\language}
1013 \def\bbl@usehooks@lang#1#2#3{%
1014   \ifx\UseHook\@undefined\else\UseHook{babel/*/#2}\fi
1015   \def\bbl@elth##1{%
1016     \bbl@cs{hk@##1}{\bbl@cs{ev@##1@#2@#3}}%
1017     \bbl@cs{ev@#2@#3}%
1018     \ifx\language\@undefined\else % Test required for Plain (?)
1019       \ifx\UseHook\@undefined\else\UseHook{babel/#1/#2}\fi
1020       \def\bbl@elth##1{%
1021         \bbl@cs{hk@##1}{\bbl@cs{ev@##1@#2@#1}}%
1022         \bbl@cs{ev@#2@#1}%
1023       \fi}

```

To ensure forward compatibility, arguments in hooks are set implicitly. So, if a further argument is added in the future, there is no need to change the existing code. Note events intended for `hyphen.cfg` are also loaded (just in case you need them for some reason).

```

1024 \def\bbl@evargs{,% <- don't delete this comma
1025   everylanguage=1,loadkernel=1,loadpatterns=1,loadexceptions=1,%
1026   adddialect=2,patterns=2,defaultcommands=0,encodedcommands=2,write=0,%
1027   beforeextras=0,afterextras=0,stopcommands=0,stringprocess=0,%

1030 \ifx\NewHook\@undefined\else
1031   \def\bbl@tempa#1#2\@{ \NewHook{babel/#1}}
1032   \bbl@foreach\bbl@evargs{\bbl@tempa#1\@}
1033 \fi

```

`\babelensure` The user command just parses the optional argument and creates a new macro named `\bbl@e@<language>`. We register a hook at the `afterextras` event which just executes this macro in a “complete” selection (which, if undefined, is `\relax` and does nothing). This part is somewhat involved because we have to make sure things are expanded the correct number of times. The macro `\bbl@e@<language>` contains `\bbl@ensure{<include>}{<exclude>}{<fontenc>}`, which in turn loops over the macros names in `\bbl@captionslist`, excluding (with the help of `\in@`) those in the `exclude` list. If the `fontenc` is given (and not `\relax`), the `\fontencoding` is also added. Then we loop over the `include` list, but if the macro already contains `\foreignlanguage`, nothing is done. Note this macro (1) is not restricted to the preamble, and (2) changes are local.

```

1034 \bbl@trace{Defining babelensure}

```

4.4 Setting up language files

`\LdfInit` `\LdfInit` macro takes two arguments. The first argument is the name of the language that will be defined in the language definition file; the second argument is either a control sequence or a string from which a control sequence should be constructed. The existence of the control sequence indicates that the file has been processed before.

At the start of processing a language definition file we always check the category code of the at-sign. We make sure that it is a ‘letter’ during the processing of the file. We also save its name as the last called option, even if not loaded.

Another character that needs to have the correct category code during processing of language definition files is the equals sign, ‘=’, because it is sometimes used in constructions with the `\let` primitive. Therefore we store its current catcode and restore it later on.

Now we check whether we should perhaps stop the processing of this file. To do this we first need to check whether the second argument that is passed to `\LdfInit` is a control sequence. We do that by looking at the first token after passing #2 through `string`. When it is equal to `\@backslashchar` we are dealing with a control sequence which we can compare with `\@undefined`.

If so, we call `\ldf@quit` to set the main language, restore the category code of the `@`-sign and call `\endinput`

When #2 was *not* a control sequence we construct one and compare it with `\relax`.

Finally we check `\originalTeX`.

```

1098 \bbl@trace{Macros for setting language files up}
1099 \def\bbl@ldfinit{%
1100   \let\bbl@screset\@empty

1120     \expandafter\ifx\csname#2\endcsname\relax\else
1121       \ldf@quit{#1}%
1122     \fi
1123   \fi
1124   \bbl@ldfinit}

```

`\ldf@quit` This macro interrupts the processing of a language definition file.

```

1125 \def\ldf@quit#1{%
1126   \expandafter\main@language\expandafter{#1}%
1127   \catcode`\@=\atcatcode \let\atcatcode\relax
1128   \catcode`\==\eqcatcode \let\eqcatcode\relax
1129   \endinput}

```

`\ldf@finish` This macro takes one argument. It is the name of the language that was defined in the language definition file.

We load the local configuration file if one is present, we set the main language (taking into account that the argument might be a control sequence that needs to be expanded) and reset the category code of the `@`-sign.

```

1130 \def\bbl@afterldf#1{% TODO. Merge into the next macro? Unused elsewhere
1131   \bbl@afterlang
1132   \let\bbl@afterlang\relax
1133   \let\BabelModifiers\relax
1134   \let\bbl@screset\relax}%
1135 \def\ldf@finish#1{%
1136   \loadlocalcfg{#1}%
1137   \bbl@afterldf{#1}%
1138   \expandafter\main@language\expandafter{#1}%
1139   \catcode`\@=\atcatcode \let\atcatcode\relax
1140   \catcode`\==\eqcatcode \let\eqcatcode\relax}

```

After the preamble of the document the commands `\LdfInit`, `\ldf@quit` and `\ldf@finish` are no longer needed. Therefore they are turned into warning messages in \TeX .

```
1141 \@onlypreamble\LdfInit
1142 \@onlypreamble\ldf@quit
1143 \@onlypreamble\ldf@finish
```

`\main@language` This command should be used in the various language definition files. It stores its argument in `\bbl@main@language`; to be used to switch to the correct language at the beginning of the document.

```
1144 \def\main@language#1{%
1145   \def\bbl@main@language{#1}%
1146   \let\language\main@language % TODO. Set locale name
1147   \bbl@id@assign
1148   \bbl@patterns{\language}}
```

We also have to make sure that some code gets executed at the beginning of the document, either when the aux file is read or, if it does not exist, when the `\AtBeginDocument` is executed. Languages do not set `\pagedir`, so we set here for the whole document to the main `\bodydir`.

```
1149 \def\bbl@beforestart{%
1150   \def\@nolanerr##1{%

1175     \select@language{#1}%
1176   \fi}
```

4.5 Shorthands

`\bbl@add@special` The macro `\bbl@add@special` is used to add a new character (or single character control sequence) to the macro `\dospecials` (and `\@sanitize` if \TeX is used). It is used only at one place, namely when `\initiate@active@char` is called (which is ignored if the char has been made active before). Because `\@sanitize` can be undefined, we put the definition inside a conditional. Items are added to the lists without checking its existence or the original catcode. It does not hurt, but should be fixed. It's already done with `\nfss@catcodes`, added in 3.10.

```
1177 \bbl@trace{Shorthands}
1178 \def\bbl@add@special#1{% 1:a macro like \", \?, etc.
1179   \bbl@add\dospecials{\do#1}% test @sanitize = \relax, for back. compat.
1180   \bbl@ifunset{@sanitize}{\bbl@add@sanitize{\@makeother#1}}%
1181   \ifx\nfss@catcodes\@undefined\else % TODO - same for above
1182     \begingroup
```

```

1183 \catcode`#1\active
1184 \nfss@catcodes
1185 \ifnum\catcode`#1=\active
1186 \endgroup
1187 \bbl@add\nfss@catcodes{\@makeother#1}%
1188 \else
1189 \endgroup
1190 \fi
1191 \fi}

```

`\bbl@remove@special` The companion of the former macro is `\bbl@remove@special`. It removes a character from the set macros `\dospecials` and `\@sanitize`, but it is not used at all in the babel core.

```

1192 \def\bbl@remove@special#1{%
1193 \begingroup
1194 \def\x##1##2{\ifnum`#1=`##2\noexpand\@empty
1195 \else\noexpand##1\noexpand##2\fi}%
1196 \def\do{\x\do}%
1197 \def\@makeother{\x\@makeother}%
1198 \edef\x{\endgroup
1199 \def\noexpand\dospecials{\dospecials}%
1200 \expandafter\ifx\csname @sanitize\endcsname\relax\else
1201 \def\noexpand\@sanitize{\@sanitize}%
1202 \fi}%
1203 \x}

```

`\initiate@active@char` A language definition file can call this macro to make a character active. This macro takes one argument, the character that is to be made active. When the character was already active this macro does nothing. Otherwise, this macro defines the control sequence `\normal@char⟨char⟩` to expand to the character in its ‘normal state’ and it defines the active character to expand to `\normal@char⟨char⟩` by default (`⟨char⟩` being the character to be made active). Later its definition can be changed to expand to `\active@char⟨char⟩` by calling `\bbl@activate{⟨char⟩}`. For example, to make the double quote character active one could have `\initiate@active@char{"}` in a language definition file. This defines " as `\active@prefix " \active@char` (where the first " is the character with its original catcode, when the shorthand is created, and `\active@char` is a single token). In protected contexts, it expands to `\protect " or \noexpand "` (ie, with the original "); otherwise `\active@char` is executed. This macro in turn expands to `\normal@char` in “safe” contexts (eg, `\label`), but `\user@active` in normal “unsafe” ones. The latter search a definition in the user, language and system levels, in this order, but if none is found, `\normal@char` is used. However, a deactivated shorthand (with `\bbl@deactivate` is defined as `\active@prefix "\normal@char`". The following macro is used to define shorthands in the three levels. It takes 4 arguments: the (string’ed) character, `\<level>@group`, `<level>@active` and `<next-level>@active` (except in system).

```

1204 \def\bbl@active@def#1#2#3#4{%
1205 \@namedef{#3#1}{%
1206 \expandafter\ifx\csname#2@sh@#1\endcsname\relax
1207 \bbl@afterelse\bbl@sh@select#2#1{#3@arg#1}{#4#1}%
1208 \else
1209 \bbl@afterfi\csname#2@sh@#1\endcsname
1210 \fi}%

```

When there is also no current-level shorthand with an argument we will check whether there is a next-level defined shorthand for this active character.

```

1211 \long\@namedef{#3@arg#1}##1{%
1212 \expandafter\ifx\csname#2@sh@#1\string##1\endcsname\relax
1213 \bbl@afterelse\csname#4#1\endcsname##1%
1214 \else
1215 \bbl@afterfi\csname#2@sh@#1\string##1\endcsname
1216 \fi}}%

```

`\initiate@active@char` calls `\@initiate@active@char` with 3 arguments. All of them are the same character with different catcodes: active, other (`\string’ed`) and the original one. This trick simplifies the code a lot.

```

1217 \def\initiate@active@char#1{%
1218   \bbl@ifunset{active@char\string#1}%
1219   {\bbl@withactive
1220    {\expandafter\initiate@active@char\expandafter}#1\string#1}%
1221   {}}

```

The very first thing to do is saving the original catcode and the original definition, even if not active, which is possible (undefined characters require a special treatment to avoid making them `\relax` and preserving some degree of protection).

```

1222 \def\@initiate@active@char#1#2#3{%
1223   \bbl@csarg\edef{oricat@#2}{\catcode`#2=\the\catcode`#2\relax}%
1224   \ifx#1\@undefined
1225     \bbl@csarg\def{oridef@#2}{\def#1{\active@prefix#1\@undefined}}%
1226   \else
1227     \bbl@csarg\let{oridef@#2}#1%
1228     \bbl@csarg\edef{oridef@#2}{%
1229       \let\noexpand#1%
1230       \expandafter\noexpand\csname bbl@oridef@@#2\endcsname}%
1231   \fi

```

If the character is already active we provide the default expansion under this shorthand mechanism. Otherwise we write a message in the transcript file, and define `\normal@char<char>` to expand to the character in its default state. If the character is mathematically active when babel is loaded (for example `'`) the normal expansion is somewhat different to avoid an infinite loop (but it does not prevent the loop if the mathcode is set to "8000 *a posteriori*").

```

1232   \ifx#1#3\relax
1233     \expandafter\let\csname normal@char#2\endcsname#3%
1234   \else
1235     \bbl@info{Making #2 an active character}%
1236     \ifnum\mathcode`#2=\ifodd\bbl@engine"1000000 \else"8000 \fi
1237     \@namedef{normal@char#2}{%
1238       \textormath{#3}{\csname bbl@oridef@@#2\endcsname}}%
1239   \else
1240     \@namedef{normal@char#2}{#3}%
1241   \fi

```

To prevent problems with the loading of other packages after babel we reset the catcode of the character to the original one at the end of the package and of each language file (except with `KeepShorthandsActive`). It is re-activate again at `\begin{document}`. We also need to make sure that the shorthands are active during the processing of the `.aux` file. Otherwise some citations may give unexpected results in the printout when a shorthand was used in the optional argument of `\bibitem` for example. Then we make it active (not strictly necessary, but done for backward compatibility).

```

1242   \bbl@restoreactive{#2}%
1243   \AtBeginDocument{%
1244     \catcode`#2\active
1245     \if@filesw
1246       \immediate\write\@mainaux{\catcode`\string#2\active}%
1247     \fi}%
1248   \expandafter\bbl@add@special\csname#2\endcsname
1249   \catcode`#2\active
1250   \fi

```

Now we have set `\normal@char<char>`, we must define `\active@char<char>`, to be executed when the character is activated. We define the first level expansion of `\active@char<char>` to check the status of the `@safe@actives` flag. If it is set to true we expand to the 'normal' version of this character; otherwise we call `\user@active<char>` to start the search of a definition in the user, language and system levels (or eventually `\normal@char<char>`).

```

1251   \let\bbl@tempa\@firstoftwo
1252   \if\string^#2%
1253     \def\bbl@tempa{\noexpand\textormath}%
1254   \else
1255     \ifx\bbl@mathnormal\@undefined\else
1256       \let\bbl@tempa\bbl@mathnormal
1257     \fi

```

```

1258 \fi
1259 \expandafter\edef\csname active@char#2\endcsname{%
1260 \bbl@tempa
1261 {\noexpand\if@safe@actives
1262 \noexpand\expandafter
1263 \expandafter\noexpand\csname normal@char#2\endcsname
1264 \noexpand\else
1265 \noexpand\expandafter
1266 \expandafter\noexpand\csname bbl@doactive#2\endcsname
1267 \noexpand\fi}%
1268 {\expandafter\noexpand\csname normal@char#2\endcsname}}%
1269 \bbl@csarg\edef{doactive#2}{%
1270 \expandafter\noexpand\csname user@active#2\endcsname}%

```

We now define the default values which the shorthand is set to when activated or deactivated. It is set to the deactivated form (globally), so that the character expands to

$$\backslash active@prefix \langle char \rangle \backslash normal@char \langle char \rangle$$

(where $\backslash active@char \langle char \rangle$ is *one* control sequence!).

```

1271 \bbl@csarg\edef{active@#2}{%
1272 \noexpand\active@prefix\noexpand#1%
1273 \expandafter\noexpand\csname active@char#2\endcsname}%
1274 \bbl@csarg\edef{normal@#2}{%
1275 \noexpand\active@prefix\noexpand#1%
1276 \expandafter\noexpand\csname normal@char#2\endcsname}%
1277 \bbl@ncarg\let#1\bbl@normal@#2}%

```

The next level of the code checks whether a user has defined a shorthand for himself with this character. First we check for a single character shorthand. If that doesn't exist we check for a shorthand with an argument.

```

1278 \bbl@active@def#2\user@group{user@active}{language@active}%
1279 \bbl@active@def#2\language@group{language@active}{system@active}%
1280 \bbl@active@def#2\system@group{system@active}{normal@char}%

```

In order to do the right thing when a shorthand with an argument is used by itself at the end of the line we provide a definition for the case of an empty argument. For that case we let the shorthand character expand to its non-active self. Also, When a shorthand combination such as ' ' ends up in a heading \TeX would see $\backslash protect \backslash protect$. To prevent this from happening a couple of shorthand needs to be defined at user level.

```

1281 \expandafter\edef\csname\user@group @sh#2@@\endcsname
1282 {\expandafter\noexpand\csname normal@char#2\endcsname}%
1283 \expandafter\edef\csname\user@group @sh#2@\string\protect\endcsname
1284 {\expandafter\noexpand\csname user@active#2\endcsname}%

```

Finally, a couple of special cases are taken care of. (1) If we are making the right quote (') active we need to change $\backslash pr@m@s$ as well. Also, make sure that a single ' in math mode 'does the right thing'. (2) If we are using the caret (^) as a shorthand character special care should be taken to make sure math still works. Therefore an extra level of expansion is introduced with a check for math mode on the upper level.

```

1285 \if\string'#2%
1286 \let\prim@s\bbl@prim@s
1287 \let\active@math@prime#1%
1288 \fi
1289 \bbl@usehooks{initiateactive}{\#1}{\#2}{\#3}}

```

The following package options control the behavior of shorthands in math mode.

```

1290 <(*More package options)> \equiv
1291 \DeclareOption{math=active}{}
1292 \DeclareOption{math=normal}{\def\bbl@mathnormal{\noexpand\textormath}}
1293 <(/More package options)>

```

Initiating a shorthand makes active the char. That is not strictly necessary but it is still done for backward compatibility. So we need to restore the original catcode at the end of package *and* the end of the *ldf*.

```

1294 \@ifpackagewith{babel}{KeepShorthandsActive}%
1295   {\let\bbl@restoreactive\@gobble}%
1296   {\def\bbl@restoreactive#1{%
1297     \bbl@exp{%
1298       \\\AfterBabelLanguage\\CurrentOption
1299       {\catcode`#1=\the\catcode`#1\relax}%
1300       \\\AtEndOfPackage
1301       {\catcode`#1=\the\catcode`#1\relax}}}%
1302   \AtEndOfPackage{\let\bbl@restoreactive\@gobble}}

```

`\bbl@sh@select` This command helps the shorthand supporting macros to select how to proceed. Note that this macro needs to be expandable as do all the shorthand macros in order for them to work in expansion-only environments such as the argument of `\hyphenation`. This macro expects the name of a group of shorthands in its first argument and a shorthand character in its second argument. It will expand to either `\bbl@firstcs` or `\bbl@scndcs`. Hence two more arguments need to follow it.

```

1303 \def\bbl@sh@select#1#2{%
1304   \expandafter\ifx\csname#1@sh@#2@sel\endcsname\relax
1305     \bbl@afterelse\bbl@scndcs
1306   \else
1307     \bbl@afterfi\csname#1@sh@#2@sel\endcsname
1308   \fi}

```

`\active@prefix` The command `\active@prefix` which is used in the expansion of active characters has a function similar to `\OT1-cmd` in that it `\protects` the active character whenever `\protect` is *not* `\@typeset@protect`. The `\@gobble` is needed to remove a token such as `\activechar:` (when the double colon was the active character to be dealt with). There are two definitions, depending of `\ifincsname` is available. If there is, the expansion will be more robust.

```

1309 \begingroup
1310 \bbl@ifunset{ifincsname}% TODO. Ugly. Correct? Only Plain?
1311   {\gdef\active@prefix#1{%
1312     \ifx\protect\@typeset@protect

1334       \fi
1335     \fi}}
1336 \endgroup

```

`\if@safe@actives` In some circumstances it is necessary to be able to reset the shorthand to its ‘normal’ value (usually the character with catcode ‘other’) on the fly. For this purpose the switch `@safe@actives` is available. The setting of this switch should be checked in the first level expansion of `\active@char⟨char⟩`. When this expansion mode is active (with `\@safe@activetrue`), something like `"13"13` becomes `"12"12` in an `\edef` (in other words, shorthands are `\string`’ed). This contrasts with

`\protected@edef`, where catcodes are always left unchanged. Once converted, they can be used safely even after this expansion mode is deactivated (with `\@safe@activesfalse`).

```
1337 \newif\if@safe@actives
1338 \@safe@activesfalse
```

`\bbl@restore@actives` When the output routine kicks in while the active characters were made “safe” this must be undone in the headers to prevent unexpected typeset results. For this situation we define a command to make them “unsafe” again.

```
1339 \def\bbl@restore@actives{\if@safe@actives\@safe@activesfalse\fi}
```

`\bbl@activate` Both macros take one argument, like `\initiate@active@char`. The macro is used to change the definition of an active character to expand to `\active@char⟨char⟩` in the case of `\bbl@activate`, or `\normal@char⟨char⟩` in the case of `\bbl@deactivate`.

```
1340 \chardef\bbl@activated\z@
1341 \def\bbl@activate#1{%
1342   \chardef\bbl@activated\@ne
1343   \bbl@withactive{\expandafter\let\expandafter}\#1%
1344   \csname bbl@active@\string#1\endcsname}
1345 \def\bbl@deactivate#1{%
1346   \chardef\bbl@activated\tw@
1347   \bbl@withactive{\expandafter\let\expandafter}\#1%
1348   \csname bbl@normal@\string#1\endcsname}
```

`\bbl@firstcs` These macros are used only as a trick when declaring shorthands.

```
\bbl@scndcs
1349 \def\bbl@firstcs#1#2{\csname#1\endcsname}
1350 \def\bbl@scndcs#1#2{\csname#2\endcsname}
```

`\declare@shorthand` The command `\declare@shorthand` is used to declare a shorthand on a certain level. It takes three arguments:

1. a name for the collection of shorthands, i.e. ‘system’, or ‘dutch’;
2. the character (sequence) that makes up the shorthand, i.e. `~` or `"a`;
3. the code to be executed when the shorthand is encountered.

The auxiliary macro `\babel@texpdf` improves the interoperativity with `hyperref` and takes 4 arguments: (1) The \TeX code in text mode, (2) the string for `hyperref`, (3) the \TeX code in math mode, and (4), which is currently ignored, but it’s meant for a string in math mode, like a minus sign instead of an hyphen (currently `hyperref` doesn’t discriminate the mode). This macro may be used in `ldf` files.

```
1351 \def\babel@texpdf#1#2#3#4{%
1352   \ifx\texorpdfstring\undefined
1353     \textormath{#1}{#3}%
1354   \else

1532 \endgroup

```

Usually the ~ is active and expands to \penalty\@M_. When it is written to the .aux file it is written expanded. To prevent that and to be able to use the character ~ as a start character for a shorthand, it is redefined here as a one character shorthand on system level. The system declaration is in most cases redundant (when ~ is still a non-break space), and in some cases is inconvenient (if ~ has been redefined); however, for backward compatibility it is maintained (some existing documents may rely on the babel value).

```

1533 \initiate@active@char{~}
1534 \declare@shorthand{system}{~}{\leavevmode\nobreak\ }
1535 \bbl@activate{~}

```

\OT1dqpos The position of the double quote character is different for the OT1 and T1 encodings. It will later be selected using the \f@encoding macro. Therefore we define two macros here to store the position of the character in these encodings.

```

1536 \expandafter\def\csname OT1dqpos\endcsname{127}
1537 \expandafter\def\csname T1dqpos\endcsname{4}

```

When the macro \f@encoding is undefined (as it is in plain T_EX) we define it here to expand to OT1

```

1538 \ifx\f@encoding\undefined
1539   \def\f@encoding{OT1}
1540 \fi

```

4.6 Language attributes

Language attributes provide a means to give the user control over which features of the language definition files he wants to enable.

\languageattribute The macro \languageattribute checks whether its arguments are valid and then activates the selected language attribute. First check whether the language is known, and then process each attribute in the list.

```

1541 \bbl@trace{Language attributes}
1542 \newcommand\languageattribute[2]{%
1543   \def\bbl@tempc{#1}%
1544   \bbl@fixname\bbl@tempc
1545   \bbl@iflanguage\bbl@tempc{%
1546     \bbl@vforeach{#2}{%

```

We want to make sure that each attribute is selected only once; therefore we store the already selected attributes in \bbl@known@attribs. When that control sequence is not yet defined this attribute is certainly not selected before.

```

1547     \ifx\bbl@known@attribs\undefined
1548       \in@false
1549     \else
1550       \bbl@xin@{,\bbl@tempc-##1,}{,\bbl@known@attribs,}%

```

```

4.7 Support for saving macro definitions

To save the meaning of control sequences using `\babel@save`, we use temporary control sequences. To save hash table entries for these control sequences, we don't use the name of the control sequence to be saved to construct the temporary name. Instead we simply use the value of a counter, which is reset to zero each time we begin to save new values. This works well because we release the saved meanings before we begin to save a new set of control sequence meanings (see `\selectlanguage` and `\originalTeX`). Note undefined macros are not undefined any more when saved – they are `\relax`'ed.

`\babel@savecnt` The initialization of a new save cycle: reset the counter to zero.
`\babel@beginsave`

```

1605 \bbl@trace{Macros for saving definitions}
1606 \def\babel@beginsave{\babel@savecnt\z@}

```

Before it's forgotten, allocate the counter and initialize all.

```

1607 \newcount\babel@savecnt
1608 \babel@beginsave

```

`\babel@save` The macro `\babel@save<csname>` saves the current meaning of the control sequence `<csname>` to `\originalTeX`². To do this, we let the current meaning to a temporary control sequence, the restore commands are appended to `\originalTeX` and the counter is incremented. The macro `\babel@savevariable<variable>` saves the value of the variable. `<variable>` can be anything allowed after the `\the` primitive. To avoid messing saved definitions up, they are saved only the very first time.

```

1609 \def\babel@save#1{%
1610   \def\bbl@tempa{{, #1,}}% Clumsy, for Plain

1699               {\csname bbl@hyphenation@\bbl@tempa\endcsname\space}%
1700               #2}}}%
1701         \fi}}

```

`\bbl@allowhyphens` This macro makes hyphenation possible. Basically its definition is nothing more than `\nobreak \hskip Opt plus Opt`³.

```

1702 \def\bbl@allowhyphens{\ifvmode\else\nobreak\hskip\z@skip\fi}
1703 \def\bbl@t@one{T1}
1704 \def\allowhyphens{\ifx\cf@encoding\bbl@t@one\else\bbl@allowhyphens\fi}

```

`\babelhyphen` Macros to insert common hyphens. Note the space before @ in `\babelhyphen`. Instead of protecting it with `\DeclareRobustCommand`, which could insert a `\relax`, we use the same procedure as shorthands, with `\active@prefix`.

```

1705 \newcommand\babelnullhyphen{\char\hyphenchar\font}
1706 \def\babelhyphen{\active@prefix\babelhyphen\bbl@hyphen}
1707 \def\bbl@hyphen{%
1708   \@ifstar{\bbl@hyphen@i @}{\bbl@hyphen@i\@empty}}
1709 \def\bbl@hyphen@i#1#2{%
1710   \bbl@ifunset{bbl@hy@#1#2\@empty}%
1711   {\csname bbl@#1usehyphen\endcsname{\discretionary{#2}{}{#2}}}%
1712   {\csname bbl@hy@#1#2\@empty\endcsname}}

```

The following two commands are used to wrap the “hyphen” and set the behavior of the rest of the word – the version with a single @ is used when further hyphenation is allowed, while that with @@ if no more hyphens are allowed. In both cases, if the hyphen is preceded by a positive space, breaking after the hyphen is disallowed.

There should not be a discretionary after a hyphen at the beginning of a word, so it is prevented if preceded by a skip. Unfortunately, this does handle cases like “(-suffix)”. `\nobreak` is always preceded by `\leavevmode`, in case the shorthand starts a paragraph.

```

1713 \def\bbl@usehyphen#1{%
1714   \leavevmode
1715   \ifdim\lastskip>\z@\mbox{#1}\else\nobreak#1\fi
1716   \nobreak\hskip\z@skip}

```

³TeX begins and ends a word for hyphenation at a glue node. The penalty prevents a linebreak at this glue node.

```

1717 \def\bbl@usehyphen#1{%
1718   \leavevmode\ifdim\lastskip>\z@\mbox{#1}\else#1\fi}

```

The following macro inserts the hyphen char.

```

1719 \def\bbl@hyphenchar{%
1720   \ifnum\hyphenchar\font=\m@ne
1721     \babeInullhyphen
1722   \else
1723     \char\hyphenchar\font
1724   \fi}

```

Finally, we define the hyphen “types”. Their names will not change, so you may use them in ldf’s. After a space, the \mbox in \bbl@hy@nobreak is redundant.

```

1725 \def\bbl@hy@soft{\bbl@usehyphen{\discretionary{\bbl@hyphenchar}{}}{}}
1726 \def\bbl@hy@@soft{\bbl@usehyphen{\discretionary{\bbl@hyphenchar}{}}{}}

1737 \def\bbl@hy@empty{\hskip\z@skip}
1738 \def\bbl@hy@@empty{\discretionary{}{}{}}

```

\bbl@disc For some languages the macro \bbl@disc is used to ease the insertion of discretionaries for letters that behave ‘abnormally’ at a breakpoint.

```

1739 \def\bbl@disc#1#2{\nobreak\discretionary{#2-}{#1}\bbl@allowhyphens}

```

4.10 Multiencoding strings

The aim following commands is to provide a common interface for strings in several encodings. They also contains several hooks which can be used by luatex and xetex. The code is organized here with pseudo-guards, so we start with the basic commands.

Tools But first, a tool. It makes global a local variable. This is not the best solution, but it works.

```

1740 \bbl@trace{Multiencoding strings}
1741 \def\bbl@tglobal#1{\global\let#1#1}

```

The second one. We need to patch \@uclclist, but it is done once and only if \SetCase is used or if strings are encoded. The code is far from satisfactory for several reasons, including the fact \@uclclist is not a list any more. Therefore a package option is added to ignore it. Instead of gobbling the macro getting the next two elements (usually \reserved@a), we pass it as argument to \bbl@uclc. The parser is restarted inside \<lang>\bbl@uclc because we do not know how many expansions are necessary (depends on whether strings are encoded). The last part is tricky – when uppercasing, we have:

```
\let\bbl@tolower\@empty\bbl@toupper\@empty
```

and starts over (and similarly when lowercasing).

```

1742 \@ifpackagewith{babel}{nocase}%
1743   {\let\bbl@patchuclc\relax}%
1744   {\def\bbl@patchuclc{% TODO. Delete. Doesn't work any more.

```

Parse the encoding info to get the label, input, and font parts.

Select the behavior of \SetString. There are two main cases, depending of if there is an optional argument: without it and strings=encoded, strings are defined always; otherwise, they are set only if they are still undefined (ie, fallback values). With labelled blocks and strings=encoded, define the strings, but with another value, define strings only if the current label or font encoding is the value of strings; otherwise (ie, no strings or a block whose label is not in strings=) do nothing. We presume the current block is not loaded, and therefore set (above) a couple of default values to gobble the arguments. Then, these macros are redefined if necessary according to several parameters.

```

There are two versions of `\bbl@scswitch`. The first version is used when `ldfs` are read, and it makes sure `\group` `\language` is reset, but only once (`\bbl@screset` is used to keep track of this). The second version is used in the preamble and packages loaded after `babel` and does nothing. The macro `\bbl@forlang` loops `\bbl@L` but its body is executed only if the value is in `\BabelLanguages` (inside `babel`) or `\date` `\language` is defined (after `babel` has been loaded). There are also two version of `\bbl@forlang`. The first one skips the current iteration if the language is not in `\BabelLanguages` (used in `ldfs`), and the second one skips undefined languages (after `babel` has been loaded).

```

1864 \def\bbl@forlang#1#2{%
1865 \bbl@for#1\bbl@L{%
1866 \bbl@xin@{,#1,},{,\BabelLanguages,}%

1886 \endgroup
1887 \endgroup
1888 \bbl@scafter}
1889 \let\bbl@endcommands\EndBabelCommands

```

Now we define commands to be used inside `\StartBabelCommands`.

Strings The following macro is the actual definition of `\SetString` when it is “active”. First save the “switcher”. Create it if undefined. Strings are defined only if undefined (ie, like `\providescommand`). With the event `stringprocess` you can preprocess the string by manipulating the value of `\BabelString`. If there are several hooks assigned to this event, preprocessing is done in the same order as defined. Finally, the string is set.

```

1890 \def\bbl@setstring#1#2{% eg, \prefacename{<string>}
1891 \bbl@forlang\bbl@tempa{%
1892 \edef\bbl@LC{\bbl@tempa\bbl@stripslash#1}%
1893 \bbl@ifunset{\bbl@LC}% eg, \germanchaptername
1894 {\bbl@exp{%
1895 \global\bbbl@add\<\bbl@G\bbl@tempa>{\bbbl@scset\#1\<\bbl@LC>}}}%
1896 }%
1897 \def\BabelString{#2}%
1898 \bbl@usehooks{stringprocess}{}%
1899 \expandafter\bbl@stringdef
1900 \csname\bbl@LC\expandafter\endcsname\expandafter{\BabelString}}

```

Now, some additional stuff to be used when encoded strings are used. Captions then include `\bbl@encoded` for string to be expanded in case transformations. It is `\relax` by default, but in `\MakeUppercase` and `\MakeLowercase` its value is a modified expandable `\@changed@cmd`.

```

1901 \ifx\bbl@opt@strings\relax

```

```

1902 \def\bbl@scset#1#2{\def#1{\bbl@encoded#2}}
1903 \bbl@patchuclc
1904 \let\bbl@encoded\relax
1905 \def\bbl@encoded@uclc#1{%
1906   \inmathwarn#1%
1907   \expandafter\ifx\csname\cf@encoding\string#1\endcsname\relax
1908     \expandafter\ifx\csname ?\string#1\endcsname\relax
1909       \TextSymbolUnavailable#1%
1910     \else
1911       \csname ?\string#1\endcsname
1912     \fi
1913   \else
1914     \csname\cf@encoding\string#1\endcsname
1915   \fi}
1916 \else
1917 \def\bbl@scset#1#2{\def#1{#2}}
1918 \fi

```

Define `\SetStringLoop`, which is actually set inside `\StartBabelCommands`. The current definition is somewhat complicated because we need a count, but `\count@` is not under our control (remember `\SetString` may call hooks). Instead of defining a dedicated count, we just “pre-expand” its value.

```

1919 <<{*Macros local to BabelCommands}>> ≡
1920 \def\SetStringLoop##1##2{%
1921   \def\bbl@templ####1{\expandafter\noexpand\csname##1\endcsname}%
1922   \count@z@
1923   \bbl@loop\bbl@tempa{##2}{% empty items and spaces are ok

2046     \endgroup}

```

4.12 Making glyphs available

This section makes a number of glyphs available that either do not exist in the OT1 encoding and have to be ‘faked’, or that are not accessible through T1enc.def.

4.12.1 Quotation marks

`\quotedblbase` In the T1 encoding the opening double quote at the baseline is available as a separate character, accessible via `\quotedblbase`. In the OT1 encoding it is not available, therefore we make it available by lowering the normal open quote character to the baseline.

```

2047 \ProvideTextCommand{\quotedblbase}{OT1}{%

```

```

2048 \save@sf@q{\set@low@box{\textquotedblright\}}%
2049 \box\z@\kern-.04em\bbl@allowhyphens}}

```

Make sure that when an encoding other than OT1 or T1 is used this glyph can still be typeset.

```

2050 \ProvideTextCommandDefault{\quotedblbase}{%
2051 \UseTextSymbol{OT1}{\quotedblbase}}

```

\quotesinglbase We also need the single quote character at the baseline.

```

2052 \ProvideTextCommand{\quotesinglbase}{OT1}{%
2053 \save@sf@q{\set@low@box{\textquoteright\}}%
2054 \box\z@\kern-.04em\bbl@allowhyphens}}

```

Make sure that when an encoding other than OT1 or T1 is used this glyph can still be typeset.

```

2055 \ProvideTextCommandDefault{\quotesinglbase}{%
2056 \UseTextSymbol{OT1}{\quotesinglbase}}

```

\guillemetleft The guillemet characters are not available in OT1 encoding. They are faked. (Wrong names with o
\guillemetright preserved for compatibility.)

```

2057 \ProvideTextCommand{\guillemetleft}{OT1}{%
2058 \ifmmode
2059 \ll
2060 \else
2061 \save@sf@q{\nobreak

2087 \ProvideTextCommandDefault{\guillemetright}{%
2088 \UseTextSymbol{OT1}{\guillemetright}}
2089 \ProvideTextCommandDefault{\guillemotleft}{%
2090 \UseTextSymbol{OT1}{\guillemotleft}}
2091 \ProvideTextCommandDefault{\guillemotright}{%
2092 \UseTextSymbol{OT1}{\guillemotright}}

```

\guilsinglleft The single guillemets are not available in OT1 encoding. They are faked.
\guilsinglright

```

2093 \ProvideTextCommand{\guilsinglleft}{OT1}{%
2094 \ifmmode
2095 <%
2096 \else
2097 \save@sf@q{\nobreak

```

```

2098      \raise.2ex\hbox{$\scriptscriptstyle<$}\bbl@allowhyphens}%
2099 \fi}
2100 \ProvideTextCommand{\guilsinglright}{OT1}{%
2101   \ifmmode
2102     >%
2103   \else
2104     \save@sf@q{\nobreak
2105       \raise.2ex\hbox{$\scriptscriptstyle>$}\bbl@allowhyphens}%
2106   \fi}

```

Make sure that when an encoding other than OT1 or T1 is used these glyphs can still be typeset.

```

2107 \ProvideTextCommandDefault{\guilsinglleft}{%
2108   \UseTextSymbol{OT1}{\guilsinglleft}}
2109 \ProvideTextCommandDefault{\guilsinglright}{%
2110   \UseTextSymbol{OT1}{\guilsinglright}}

```

4.12.2 Letters

`\ij` The dutch language uses the letter ‘ij’. It is available in T1 encoded fonts, but not in the OT1 encoded `\IJ` fonts. Therefore we fake it for the OT1 encoding.

```

2111 \DeclareTextCommand{\ij}{OT1}{%
2112   i\kern-0.02em\bbl@allowhyphens j}
2113 \DeclareTextCommand{\IJ}{OT1}{%
2114   I\kern-0.02em\bbl@allowhyphens J}
2115 \DeclareTextCommand{\ij}{T1}{\char188}
2116 \DeclareTextCommand{\IJ}{T1}{\char156}

```

Make sure that when an encoding other than OT1 or T1 is used these glyphs can still be typeset.

```

2117 \ProvideTextCommandDefault{\ij}{%
2118   \UseTextSymbol{OT1}{\ij}}
2119 \ProvideTextCommandDefault{\IJ}{%
2120   \UseTextSymbol{OT1}{\IJ}}

```

`\dj` The croatian language needs the letters `\dj` and `\DJ`; they are available in the T1 encoding, but not in the OT1 encoding by default.

Some code to construct these glyphs for the OT1 encoding was made available to me by Stipčević Mario, (stipcevic@olimp.irb.hr).

```

2121 \def\crrtic@{\hrule height0.1ex width0.3em}
2122 \def\crttic@{\hrule height0.1ex width0.33em}
2123 \def\ddj@{%

\SS For the T1 encoding \SS is defined and selects a specific glyph from the font, but for other encodings it is not available. Therefore we make it available here.

```
2144 \DeclareTextCommand{\SS}{OT1}{\SS}
2145 \ProvideTextCommandDefault{\SS}{\UseTextSymbol{OT1}{\SS}}
```

4.12.3 Shorthands for quotation marks

Shorthands are provided for a number of different quotation marks, which make them usable both outside and inside mathmode. They are defined with \ProvideTextCommandDefault, but this is very likely not required because their definitions are based on encoding-dependent macros.

\glq The ‘german’ single quotes.

```
\grq 2146 \ProvideTextCommandDefault{\glq}{%
2147   \textormath{\quotesinglbase}{\mbox{\quotesinglbase}}}

The definition of \grq depends on the fontencoding. With T1 encoding no extra kerning is needed.

2148 \ProvideTextCommand{\grq}{T1}{%
2149   \textormath{\kern\z@\textquoteleft}{\mbox{\textquoteleft}}}
2150 \ProvideTextCommand{\grq}{TU}{%
2151   \textormath{\textquoteleft}{\mbox{\textquoteleft}}}
2152 \ProvideTextCommand{\grq}{OT1}{%
2153   \save@sf@q{\kern-.0125em
2154     \textormath{\textquoteleft}{\mbox{\textquoteleft}}}%
2155     \kern.07em\relax}}
2156 \ProvideTextCommandDefault{\grq}{\UseTextSymbol{OT1}{\grq}}
```

\glqq The ‘german’ double quotes.

```
\grqq 2157 \ProvideTextCommandDefault{\glqq}{%
2158   \textormath{\quotedblbase}{\mbox{\quotedblbase}}}

The definition of \grqq depends on the fontencoding. With T1 encoding no extra kerning is needed.

2159 \ProvideTextCommand{\grqq}{T1}{%
2160   \textormath{\textquotedblleft}{\mbox{\textquotedblleft}}}
2161 \ProvideTextCommand{\grqq}{TU}{%
2162   \textormath{\textquotedblleft}{\mbox{\textquotedblleft}}}
2163 \ProvideTextCommand{\grqq}{OT1}{%
2164   \save@sf@q{\kern-.07em
2165     \textormath{\textquotedblleft}{\mbox{\textquotedblleft}}}%
2166     \kern.07em\relax}}
2167 \ProvideTextCommandDefault{\grqq}{\UseTextSymbol{OT1}{\grqq}}
```

\flq The ‘french’ single guillemets.

```
\frq 2168 \ProvideTextCommandDefault{\flq}{%
2169   \textormath{\guilsinglleft}{\mbox{\guilsinglleft}}}
2170 \ProvideTextCommandDefault{\frq}{%
2171   \textormath{\guilsinglright}{\mbox{\guilsinglright}}}
```

\flqq The ‘french’ double guillemets.

```
\frqq 2172 \ProvideTextCommandDefault{\flqq}{%
2173   \textormath{\guillemetleft}{\mbox{\guillemetleft}}}
2174 \ProvideTextCommandDefault{\frqq}{%
2175   \textormath{\guillemetright}{\mbox{\guillemetright}}}
```

4.12.4 Umlauts and tremas

The command \" needs to have a different effect for different languages. For German for instance, the ‘umlaut’ should be positioned lower than the default position for placing it over the letters a, o, u, A, O and U. When placed over an e, i, E or I it can retain its normal position. For Dutch the same glyph is always placed in the lower position.

`\umlauthigh` To be able to provide both positions of `\` we provide two commands to switch the positioning, the default will be `\umlauthigh` (the normal positioning).

```

2176 \def\umlauthigh{%
2177   \def\bbl@umlauta##1{\leavevmode\bgroup%
2178     \accent\csname\fontencoding dqpos\endcsname
2179     ##1\bbl@allowhyphens\egroup}%
2180   \let\bbl@umlaute\bbl@umlauta}
2181 \def\umlautlow{%
2182   \def\bbl@umlauta{\protect\lower@umlaut}}
2183 \def\umlautelow{%
2184   \def\bbl@umlaute{\protect\lower@umlaut}}
2185 \umlauthigh

```

`\lower@umlaut` The command `\lower@umlaut` is used to position the `\` closer to the letter. We want the umlaut character lowered, nearer to the letter. To do this we need an extra *<dimen>* register.

```

2186 \expandafter\ifx\csname U@D\endcsname\relax
2187   \csname newdimen\endcsname\U@D
2188 \fi

```

The following code fools T_EX's `make_accent` procedure about the current x-height of the font to force another placement of the umlaut character. First we have to save the current x-height of the font, because we'll change this font dimension and this is always done globally.

Then we compute the new x-height in such a way that the umlaut character is lowered to the base character. The value of `.45ex` depends on the METAFONT parameters with which the fonts were built. (Just try out, which value will look best.) If the new x-height is too low, it is not changed. Finally we call the `\accent` primitive, reset the old x-height and insert the base character in the argument.

```

2189 \def\lower@umlaut#1{%
2190   \leavevmode\bgroup
2191   \U@D 1ex%
2192   {\setbox\z@\hbox{%
2193     \char\csname\fontencoding dqpos\endcsname}%
2194     \dimen@ -.45ex\advance\dimen@\ht\z@
2195     \ifdim 1ex<\dimen@ \fontdimen5\font\dimen@ \fi}%
2196   \accent\csname\fontencoding dqpos\endcsname
2197   \fontdimen5\font\U@D #1%
2198   \egroup}

```

For all vowels we declare `\` to be a composite command which uses `\bbl@umlauta` or `\bbl@umlaute` to position the umlaut character. We need to be sure that these definitions override the ones that are provided when the package `fontenc` with option `OT1` is used. Therefore these declarations are postponed until the beginning of the document. Note these definitions only apply to some languages, but `babel` sets them for *all* languages – you may want to redefine `\bbl@umlauta` and/or `\bbl@umlaute` for a language in the corresponding `ldf` (using the `babel` switching mechanism, of course).

```

2199 \AtBeginDocument{%
2200   \DeclareTextCompositeCommand{\}{OT1}{a}{\bbl@umlauta{a}}%
2201   \DeclareTextCompositeCommand{\}{OT1}{e}{\bbl@umlaute{e}}%
2202   \DeclareTextCompositeCommand{\}{OT1}{i}{\bbl@umlaute{i}}%
2203   \DeclareTextCompositeCommand{\}{OT1}{\i}{\bbl@umlaute{i}}%
2204   \DeclareTextCompositeCommand{\}{OT1}{o}{\bbl@umlauta{o}}%
2205   \DeclareTextCompositeCommand{\}{OT1}{u}{\bbl@umlauta{u}}%
2206   \DeclareTextCompositeCommand{\}{OT1}{A}{\bbl@umlauta{A}}%
2207   \DeclareTextCompositeCommand{\}{OT1}{E}{\bbl@umlaute{E}}%
2208   \DeclareTextCompositeCommand{\}{OT1}{I}{\bbl@umlaute{I}}%
2209   \DeclareTextCompositeCommand{\}{OT1}{O}{\bbl@umlauta{O}}%
2210   \DeclareTextCompositeCommand{\}{OT1}{U}{\bbl@umlauta{U}}%

```

Finally, make sure the default hyphenrules are defined (even if empty). For internal use, another empty `\language` is defined. Currently used in Amharic.

```

2211 \ifx\l@english\undefined

Now, the ‘main loop’, which **must be executed inside a group**. At this point, \bbl@inidata may contain data declared in \babelprovide, with ‘slashed’ keys. There are 3 steps: first read the ini file and store it; then traverse the stored values, and process some groups if required (date, captions, labels, counters); finally, ‘export’ some values by defining global macros (identification, typography, characters, numbers). The second argument is 0 when called to read the minimal data for fonts; with \babelprovide it’s either 1 or 2.

```

A key with a slash in \babelprovide replaces the value in the ini file (which is ignored altogether). The mechanism is simple (but suboptimal): add the data to the ini one (at this point the ini file has not yet been read), and define a dummy macro. When the ini file is read, just skip the corresponding key and reset the macro (in \bbl@inistore above).

```

Key-value pairs are treated differently depending on the section in the ini file. The following macros are the readers for identification and typography. Note \bbl@ini@exports is called always (via \bbl@inisec), while \bbl@after@ini must be called explicitly after \bbl@read@ini if necessary. Although BCP 47 doesn't treat '-x-' as an extension, the CLDR and many other sources do (as a *private use extension*). For consistency with other single-letter subtags or 'singletons', here is considered an extension, too.

```

To show correctly some captions in a few languages, we need to patch some internal macros, because the order is hardcoded. For example, in Japanese the chapter number is surrounded by two string, while in Hungarian is placed after. These replacement works in many classes, but not all. Actually,

the following lines are somewhat tentative.

```

```

Dates will require some macros for the basic formatting. They may be redefined by language, so “semi-public” names (camel case) are used. Oddly enough, the CLDR places particles like “de” inconsistently in either in the date or in the month name. Note after \bbl@replace\toks@ contains the resulting string, which is used by \bbl@replace@finish@iii (this implicit behavior doesn’t seem a good idea, but it’s efficient).

The following ini reader ignores everything but the identification section. It is called when a font is defined (ie, when the language is first selected) to know which script/language must be enabled. This means we must make sure a few characters are not active. The ini is not read directly, but with a proxy tex file named as the language (which means any code in it must be skipped, too).

```

```

The code for additive counters is somewhat tricky and it's based on the fact the arguments just before @@ collects digits which have been left 'unused' in previous arguments, the first of them being the number of digits in the number to be converted. This explains the reverse set 76543210. Digits above 10000 are not handled yet. When the key contains the subkey .F., the number after is treated as an special case, for a fixed form (see babel-he.ini, for example).

3685 <*package>

```

5.1 Cross referencing macros

The \LaTeX book states:

The key argument is any sequence of letters, digits, and punctuation symbols; upper- and lowercase letters are regarded as different.

When the above quote should still be true when a document is typeset in a language that has active characters, special care has to be taken of the category codes of these characters when they appear in an argument of the cross referencing macros.

When a cross referencing command processes its argument, all tokens in this argument should be character tokens with category ‘letter’ or ‘other’.

The following package options control which macros are to be redefined.

```

3686 <(*More package options)> ≡
3687 \DeclareOption{safe=none}{\let\bbl@opt@safe\@empty}
3688 \DeclareOption{safe=bib}{\def\bbl@opt@safe{B}}
3689 \DeclareOption{safe=ref}{\def\bbl@opt@safe{R}}
3690 \DeclareOption{safe=refbib}{\def\bbl@opt@safe{BR}}
3691 \DeclareOption{safe=bibref}{\def\bbl@opt@safe{BR}}
3692 <(/More package options)>

```

\backslash newl@bel First we open a new group to keep the changed setting of \backslash protect local and then we set the \backslash safe@actives switch to true to make sure that any shorthand that appears in any of the arguments immediately expands to its non-active self.

```

3693 \bbl@trace{Cross referencing macros}
3694 \ifx\bbl@opt@safe\@empty\else % ie, if 'ref' and/or 'bib'
3695 \def\newl@bel#1#2#3{%
3696 {\@safe@activetrue
3697 \bbl@ifunset{#1@#2}%
3698 \relax
3699 {\gdef\@multiplelabels{%
3700 \@latex@warning@no@line{There were multiply-defined labels}}%
3701 \@latex@warning@no@line{Label `#2' multiply defined}}%
3702 \global\@namedef{#1@#2}{#3}}}%

```

\backslash testdef An internal \LaTeX macro used to test if the labels that have been written on the .aux file have changed. It is called by the \backslash enddocument macro.

```

3703 \CheckCommand*\@testdef[3]{%
3704 \def\reserved@a{#3}%
3705 \expandafter\ifx\csname#1@#2\endcsname\reserved@a
3706 \else
3707 \@tempwattrue
3708 \fi}

```

Now that we made sure that `\@testdef` still has the same definition we can rewrite it. First we make the shorthands ‘safe’. Then we use `\bbl@tempa` as an ‘alias’ for the macro that contains the label which is being checked. Then we define `\bbl@tempb` just as `\@newl@bel` does it. When the label is defined we replace the definition of `\bbl@tempa` by its meaning. If the label didn’t change, `\bbl@tempa` and `\bbl@tempb` should be identical macros.

```

3709 \def\@testdef#1#2#3{% TODO. With @samestring?
3710 \@safe@activestrue
3711 \expandafter\let\expandafter\bbl@tempa\csname #1@#2\endcsname

```

`\@citex` The macro used to cite from a bibliography, `\cite`, uses an internal macro, `\@citex`. It is this internal macro that picks up the argument(s), so we redefine this internal macro and leave `\cite` alone. The first argument is used for typesetting, so the shorthands need only be deactivated in the second argument.

```

3748 \bbl@xin@{B}\bbl@opt@safe
3749 \ifin@
3750 \bbl@redefine\@citex[#1]#2{%
3751 \@safe@activestrue\edef\@tempa{#2}\@safe@activesfalse
3752 \org@@citex[#1]{\@tempa}}

```

Unfortunately, the packages `natbib` and `cite` need a different definition of `\@citex`... To begin with, `natbib` has a definition for `\@citex` with *three* arguments... We only know that a package is loaded when `\begin{document}` is executed, so we need to postpone the different redefinition.

```

3753 \AtBeginDocument{%
3754 \ifpackageloaded{natbib}{%

```

Notice that we use `\def` here instead of `\bbl@redefine` because `\org@@citex` is already defined and we don't want to overwrite that definition (it would result in parameter stack overflow because of a circular definition).

(Recent versions of `natbib` change dynamically `\@citex`, so PR4087 doesn't seem fixable in a simple way. Just load `natbib` before.)

```

3755 \def\@citex[#1][#2]#3{%
3756 \@safe@activetrue\edef\@tempa{#3}\@safe@activesfalse
3757 \org@@citex[#1][#2]{\@tempa}}%
3758 }{}}

```

The package `cite` has a definition of `\@citex` where the shorthands need to be turned off in both arguments.

```

3759 \AtBeginDocument{%
3760 \ifpackageloaded{cite}{%
3761 \def\@citex[#1]#2{%
3762 \@safe@activetrue\org@@citex[#1]{#2}\@safe@activesfalse}%
3763 }{}}

```

`\nocite` The macro `\nocite` which is used to instruct \LaTeX to extract uncited references from the database.

```

3764 \bbl@redefine\nocite#1{%
3765 \@safe@activetrue\org@nocite{#1}\@safe@activesfalse}

```

`\bibcite` The macro that is used in the `.aux` file to define citation labels. When packages such as `natbib` or `cite` are not loaded its second argument is used to typeset the citation label. In that case, this second argument can contain active characters but is used in an environment where `\@safe@activetrue` is in effect. This switch needs to be reset inside the `\hbox` which contains the citation label. In order to determine during `.aux` file processing which definition of `\bibcite` is needed we define `\bibcite` in such a way that it redefines itself with the proper definition. We call `\bbl@cite@choice` to select the proper definition for `\bibcite`. This new definition is then activated.

```

3766 \bbl@redefine\bibcite{%
3767 \bbl@cite@choice
3768 \bibcite}

```

`\bbl@bibcite` The macro `\bbl@bibcite` holds the definition of `\bibcite` needed when neither `natbib` nor `cite` is loaded.

```

3769 \def\bbl@bibcite#1#2{%
3770 \org@bibcite{#1}{\@safe@activesfalse#2}}

```

`\bbl@cite@choice` The macro `\bbl@cite@choice` determines which definition of `\bibcite` is needed. First we give `\bibcite` its default definition.

```

3771 \def\bbl@cite@choice{%
3772 \global\let\bibcite\bbl@bibcite
3773 \ifpackageloaded{natbib}{\global\let\bibcite\org@bibcite}}%

5.2 Marks

`\markright` Because the output routine is asynchronous, we must pass the current language attribute to the head lines. To achieve this we need to adapt the definition of `\markright` and `\markboth` somewhat. However, headlines and footlines can contain text outside marks; for that we must take some actions in the output routine if the 'headfoot' options is used.

We need to make some redefinitions to the output routine to avoid an endless loop and to correctly handle the page number in bidi documents.

```

3785 \bbl@trace{Marks}
3786 \IfBabelLayout{sectioning}
3787   {\ifx\bbl@opt@headfoot\@nnil

```

`\markboth` The definition of `\markboth` is equivalent to that of `\markright`, except that we need two token registers. The documentclasses report and book define and set the headings for the page. While doing so they also store a copy of `\markboth` in `\@mkboth`. Therefore we need to check whether `\@mkboth` has already been set. If so we need to do that again with the new definition of `\markboth`. (As of Oct 2019, \TeX stores the definition in an intermediate macro, so it's not necessary anymore, but it's preserved for older versions.)

```

```

5.3 Preventing clashes with other packages

5.3.1 ifthen

`\ifthenelse` Sometimes a document writer wants to create a special effect depending on the page a certain fragment of text appears on. This can be achieved by the following piece of code:

```

\ifthenelse{\isodd{\pageref{some:label}}}{
  {code for odd pages}
  {code for even pages}
}

```

In order for this to work the argument of `\isodd` needs to be fully expandable. With the above redefinition of `\pageref` it is not in the case of this example. To overcome that, we add some code to the definition of `\ifthenelse` to make things work.

We want to revert the definition of `\pageref` and `\ref` to their original definition for the first argument of `\ifthenelse`, so we first need to store their current meanings.

Then we can set the `\@safe@actives` switch and call the original `\ifthenelse`. In order to be able to use shorthands in the second and third arguments of `\ifthenelse` the resetting of the switch *and* the definition of `\pageref` happens inside those arguments.

```

3825 \bbl@trace{Preventing clashes with other packages}
3826 \ifx\org@ref\undefined\else
3827   \bbl@xin@{R}\bbl@opt@safe
3828   \ifin@
3829     \AtBeginDocument{%
3830       \@ifpackageloaded{ifthen}{%
3831         \bbl@redefine@long\ifthenelse#1#2#3{%
3832           \let\bbl@temp@pref\pageref
3833           \let\pageref\org@pageref
3834           \let\bbl@temp@ref\ref
3835           \let\ref\org@ref
3836           \@safe@activestrue
3837           \org@ifthenelse{#1}%
3838             {\let\pageref\bbl@temp@pref
3839              \let\ref\bbl@temp@ref
3840              \@safe@activesfalse
3841              #2}%
3842             {\let\pageref\bbl@temp@pref
3843              \let\ref\bbl@temp@ref
3844              \@safe@activesfalse
3845              #3}%
3846           }%
3847         }{}%
3848       }
3849 \fi

```

5.3.2 varioref

`\@vpageref` When the package `varioref` is in use we need to modify its internal command `\@vpageref` in order to prevent problems when an active character ends up in the argument of `\vref`. The same needs to happen for `\vrefpagemum`.

```

3850 \AtBeginDocument{%
3851   \@ifpackageloaded{varioref}{%
3852     \bbl@redefine\@vpageref#1[#2]#3{%
3853       \@safe@activestrue
3854       \org@@@vpageref{#1}[#2]#3}%
3855     \@safe@activesfalse}%
3856   \bbl@redefine\vrefpagemum#1#2{%
3857     \@safe@activestrue
3858     \org@vrefpagemum{#1}#2}%
3859   \@safe@activesfalse}%

```

The package `varioref` defines `\Ref` to be a robust command which uppercases the first character of the reference text. In order to be able to do that it needs to access the expandable form of `\ref`. So we employ a little trick here. We redefine the (internal) command `\Ref_` to call `\org@ref` instead of `\ref`. The disadvantage of this solution is that whenever the definition of `\Ref` changes, this definition needs to be updated as well.

```

3860   \expandafter\def\csname Ref_ \endcsname#1{%
3861     \protected@edef\@tempa{\org@ref{#1}}\expandafter\MakeUppercase\@tempa}
3862   }{}%

```

```

3863 }
3864 \fi

```

5.3.3 hhline

`\hhline` Delaying the activation of the shorthand characters has introduced a problem with the `hhline` package. The reason is that it uses the ‘:’ character which is made active by the french support in `babel`. Therefore we need to *reload* the package when the ‘:’ is an active character. Note that this happens *after* the category code of the @-sign has been changed to other, so we need to temporarily change it to letter again.

```

3865 \AtEndOfPackage{%
3866   \AtBeginDocument{%
3867     \ifpackageloaded{hhline}%
3868       {\expandafter\ifx\csname normal@char\string\endcsname\relax
3869         \else
3870           \makeatletter
3871           \def\@currname{hhline}\input{hhline.sty}\makeatother
3872           \fi}%
3873     {}}}

```

`\substitutefontfamily` Deprecated. Use the tools provides by \TeX . The command `\substitutefontfamily` creates an .fd file on the fly. The first argument is an encoding mnemonic, the second and third arguments are font family names.

```

3874 \def\substitutefontfamily#1#2#3{%
3875   \lowercase{\immediate\openout15=#1#2.fd\relax}%
3876   \immediate\write15{%
3877     \string\ProvidesFile{#1#2.fd}%
3878     [\the\year/\two@digits{\the\month}/\two@digits{\the\day}
3879     \space generated font description file]^^J
3880     \string\DeclareFontFamily{#1}{#2}{^^J

3884     \string\DeclareFontShape{#1}{#2}{m}{sc}{<->ssub * #3/m/sc}{^^J
3885     \string\DeclareFontShape{#1}{#2}{b}{n}{<->ssub * #3/bx/n}{^^J
3886     \string\DeclareFontShape{#1}{#2}{b}{it}{<->ssub * #3/bx/it}{^^J
3887     \string\DeclareFontShape{#1}{#2}{b}{sl}{<->ssub * #3/bx/sl}{^^J
3888     \string\DeclareFontShape{#1}{#2}{b}{sc}{<->ssub * #3/bx/sc}{^^J
3889     }%
3890     \closeout15
3891   }
3892 \@onlypreamble\substitutefontfamily

```

5.4 Encoding and fonts

Because documents may use non-ASCII font encodings, we make sure that the logos of \TeX and \LaTeX always come out in the right encoding. There is a list of non-ASCII encodings. Requested encodings are currently stored in `\@fontenc@load@list`. If a non-ASCII has been loaded, we define versions of \TeX and \LaTeX for them using `\ensureascii`. The default ASCII encoding is set, too (in reverse order): the “main” encoding (when the document begins), the last loaded, or OT1.

```

\ensureascii

3893 \bbl@trace{Encoding and fonts}
3894 \newcommand\BabelNonASCII{LGR,X2,OT2,OT3,OT6,LHE,LWN,LMA,LMC,LMS,LMU}
3895 \newcommand\BabelNonText{TS1,T3,TS3}
3896 \let\org@TeX\TeX
3897 \let\org@LaTeX\LaTeX
3898 \let\ensureascii\@firstofone
3899 \AtBeginDocument{%
3900   \def\@elt#1{#1}%
3901   \edef\bbl@tempa{\expandafter\@gobbletwo\@fontenc@load@list}%
3902   \let\@elt\relax

```

```

3903 \let\bbl@tempb\@empty
3904 \def\bbl@tempc{OT1}%
3905 \bbl@foreach\BabelNonASCII{% LGR loaded in a non-standard way
3906   \bbl@ifunset{T@#1}{ }\def\bbl@tempb{#1}}}%
3907 \bbl@foreach\bbl@tempa{%
3908   \bbl@xin@{#1}{\BabelNonASCII}%
3909   \ifin@
3910     \def\bbl@tempb{#1}% Store last non-ascii
3911   \else\bbl@xin@{#1}{\BabelNonText}% Pass
3912     \ifin@\else
3913       \def\bbl@tempc{#1}% Store last ascii
3914     \fi
3915   \fi}%
3916 \ifx\bbl@tempb\@empty\else
3917   \bbl@xin@{,\cf@encoding,}{,\BabelNonASCII,\BabelNonText,}%
3918   \ifin@\else
3919     \edef\bbl@tempc{\cf@encoding}% The default if ascii wins
3920   \fi
3921   \edef\ensureascii#1{%
3922     {\noexpand\fontencoding{\bbl@tempc}\noexpand\selectfont#1}}%
3923   \DeclareTextCommandDefault{\TeX}{\ensureascii{\org@TeX}}%
3924   \DeclareTextCommandDefault{\LaTeX}{\ensureascii{\org@LaTeX}}%
3925   \fi}

```

Now comes the old deprecated stuff (with a little change in 3.9l, for fontspec). The first thing we need to do is to determine, at `\begin{document}`, which latin fontencoding to use.

`\latinencoding` When text is being typeset in an encoding other than ‘latin’ (OT1 or T1), it would be nice to still have Roman numerals come out in the Latin encoding. So we first assume that the current encoding at the end of processing the package is the Latin encoding.

```

3926 \AtEndOfPackage{\edef\latinencoding{\cf@encoding}}

```

But this might be overruled with a later loading of the package fontenc. Therefore we check at the execution of `\begin{document}` whether it was loaded with the T1 option. The normal way to do this (using `\ifpackageloaded`) is disabled for this package. Now we have to revert to parsing the internal macro `\@filelist` which contains all the filenames loaded.

```

3927 \AtBeginDocument{%
3928   \@ifpackageloaded{fontspec}%
3929   {\xdef\latinencoding{%
3930     \ifx\UTFencname\undefined
3931       EU\ifcase\bbl@engine\or2\or1\fi
3932     \else
3933       \UTFencname
3934     \fi}}%
3935   {\gdef\latinencoding{OT1}%
3936     \ifx\cf@encoding\bbl@t@one
3937       \xdef\latinencoding{\bbl@t@one}%
3938     \else
3939       \def\@elt#1{, #1,}%
3940       \edef\bbl@tempa{\expandafter\@gobbletwo\@fontenc@load@list}%
3941       \let\@elt\relax
3942       \bbl@xin@{, T1, }\bbl@tempa
3943       \ifin@
3944         \xdef\latinencoding{\bbl@t@one}%
3945       \fi
3946     \fi}}

```

`\latintext` Then we can define the command `\latintext` which is a declarative switch to a latin font-encoding. Usage of this macro is deprecated.

```

3947 \DeclareRobustCommand{\latintext}{%
3948   \fontencoding{\latinencoding}\selectfont
3949   \def\encodingdefault{\latinencoding}}

```

`\textlatin` This command takes an argument which is then typeset using the requested font encoding. In order to avoid many encoding switches it operates in a local scope.

```
3950 \ifx\@undefined\DeclareTextFontCommand
3951   \DeclareRobustCommand{\textlatin}[1]{\leavevmode{\latintext #1}}
3952 \else
3953   \DeclareTextFontCommand{\textlatin}{\latintext}
3954 \fi
```

For several functions, we need to execute some code with `\selectfont`. With \LaTeX 2021-06-01, there is a hook for this purpose.

```
3955 \def\bbl@patchfont#1{\AddToHook{selectfont}{#1}}
```

5.5 Basic bidi support

Work in progress. This code is currently placed here for practical reasons. It will be moved to the correct place soon, I hope.

It is loosely based on `rlbabel.def`, but most of it has been developed from scratch. This `babel` module (by Johannes Braams and Boris Lavva) has served the purpose of typesetting R documents for two decades, and despite its flaws I think it is still a good starting point (some parts have been copied here almost verbatim), partly thanks to its simplicity. I’ve also looked at `ARABI` (by Youssef Jabri), which is compatible with `babel`.

There are two ways of modifying macros to make them “bidi”, namely, by patching the internal low-level macros (which is what I have done with lists, columns, counters, tocs, much like `rlbabel` did), and by introducing a “middle layer” just below the user interface (sectioning, footnotes).

- `pdfTeX` provides a minimal support for bidi text, and it must be done by hand. Vertical typesetting is not possible.
- `xetex` is somewhat better, thanks to its font engine (even if not always reliable) and a few additional tools. However, very little is done at the paragraph level. Another challenging problem is text direction does not honour \TeX grouping.
- `luatex` can provide the most complete solution, as we can manipulate almost freely the node list, the generated lines, and so on, but bidi text does not work out of the box and some development is necessary. It also provides tools to properly set left-to-right and right-to-left page layouts. As `Lua \TeX -ja` shows, vertical typesetting is possible, too.

```

5.6 Local Language Configuration

`\loadlocalcfg` At some sites it may be necessary to add site-specific actions to a language definition file. This can be done by creating a file with the same name as the language definition file, but with the extension `.cfg`. For instance the file `norsk.cfg` will be loaded when the language definition file `norsk.ldf` is loaded.

For plain-based formats we don't want to override the definition of `\loadlocalcfg` from `plain.def`.

```

4122 \bbl@trace{Local Language Configuration}
4123 \ifx\loadlocalcfg\@undefined
4124   \ifpackagewith{babel}{noconfigs}%
4125     {\let\loadlocalcfg@gobble}%

4130               *}}%
4131     \@empty}}
4132 \fi

```

5.7 Language options

Languages are loaded when processing the corresponding option *except* if a main language has been set. In such a case, it is not loaded until all options has been processed. The following macro inputs the `ldf` file and does some additional checks (`\input` works, too, but possible errors are not caught).

```

4133 \bbl@trace{Language options}
4134 \let\bbl@afterlang\relax
4135 \let\BabelModifiers\relax
4136 \let\bbl@loaded@empty
4137 \def\bbl@load@language#1{%
4138   \InputIfFileExists{#1.ldf}%

4169 \DeclareOption{ukrainian}{\bbl@try@load@lang{}{ukraineb}{}}
4170 \DeclareOption{uppersorbian}{\bbl@try@load@lang{}{usorbian}{}}

```

Another way to extend the list of ‘known’ options for babel was to create the file `bblopts.cfg` in which one can add option declarations. However, this mechanism is deprecated – if you want an alternative name for a language, just create a new `.ldf` file loading the actual one. You can also set the name of the file with the package option `config=<name>`, which will load `<name>.cfg` instead.

```

4171 \ifx\bbl@opt@config\@nnil

4185     Perhaps you misspelled it.}}%
4186 \fi

```

Recognizing global options in packages not having a closed set of them is not trivial, as for them to be processed they must be defined explicitly. So, package options not yet taken into account and stored in `bbl@language@opts` are assumed to be languages. If not declared above, the names of the option and the file are the same. We first pre-process the class and package options to determine the main language, which is processed in the third ‘main’ pass, *except* if all files are ldf *and* there is no main key. In the latter case (`\bbl@opt@main` is still `\@nnil`), the traditional way to set the main language is kept — the last loaded is the main language.

```

4187 \ifx\bbl@opt@main\@nnil
4188   \ifnum\bbl@iniflag>\z@ % if all ldf's: set implicitly, no main pass
4189     \let\bbl@tempb\@empty
4190     \edef\bbl@tempa{\@classoptionslist,\bbl@language@opts}%
4191     \bbl@foreach\bbl@tempa{\edef\bbl@tempb{#1,\bbl@tempb}}%
4192     \bbl@foreach\bbl@tempb{%   \bbl@tempb is a reversed list
4193       \ifx\bbl@opt@main\@nnil % ie, if not yet assigned
4194         \ifodd\bbl@iniflag % = *=

```

```

4195         \IfFileExists{babel-#1.tex}{\def\bbl@opt@main{#1}}{}%
4196     \else % n +=
4197         \IfFileExists{#1.ldf}{\def\bbl@opt@main{#1}}{}%
4198     \fi
4199 \fi}%
4200 \fi
4201 \else
4202     \bbl@info{Main language set with 'main='. Except if you have\\%
4203         problems, prefer the default mechanism for setting\\%
4204         the main language, ie, as the last declared.\\%
4205         Reported}
4206 \fi

```

A few languages are still defined explicitly. They are stored in case they are needed in the ‘main’ pass (the value can be \relax).

```

4207 \ifx\bbl@opt@main\@nnil\else
4208     \bbl@ncarg\let\bbl@loadmain{ds@\bbl@opt@main}%
4209     \expandafter\let\csname ds@\bbl@opt@main\endcsname\relax
4210 \fi

```

Now define the corresponding loaders. With package options, assume the language exists. With class options, check if the option is a language by checking if the correspondin file exists.

```

4211 \bbl@foreach\bbl@language@opts{%
4212     \def\bbl@tempa{#1}%
4213     \ifx\bbl@tempa\bbl@opt@main\else
4214         \ifnum\bbl@iniflag<\tw@ % 0 0 (other = ldf)
4215             \bbl@ifunset{ds@#1}%
4216             {\DeclareOption{#1}{\bbl@load@language{#1}}}%
4217             {}%

4221                 \babelprovide[import]{#1}%
4222                 \bbl@afterldf{}}%
4223         \fi
4224     \fi}
4225 \bbl@foreach\@classoptionslist{%
4226     \def\bbl@tempa{#1}%
4227     \ifx\bbl@tempa\bbl@opt@main\else
4228         \ifnum\bbl@iniflag<\tw@ % 0 0 (other = ldf)
4229             \bbl@ifunset{ds@#1}%
4230             {\IfFileExists{#1.ldf}%
4231              {\DeclareOption{#1}{\bbl@load@language{#1}}}%
4232              {}}%
4233         \else % + * (other = ini)
4234             \IfFileExists{babel-#1.tex}%
4235             {\DeclareOption{#1}{%
4236                 \bbl@ldfinit
4237                 \babelprovide[import]{#1}%
4238                 \bbl@afterldf{}}}%
4239             {}%
4240         \fi
4241     \fi}
4242 \fi}

```

And we are done, because all options for this pass has been declared. Those already processed in the first pass are just ignored.

The options have to be processed in the order in which the user specified them (but remember class options are processes before):

```

4243 \def\AfterBabelLanguage#1{%
4244     \bbl@ifsamestring\CurrentOption{#1}{\global\bbl@add\bbl@afterlang{}}
4245     \DeclareOption*{}
4246 \ProcessOptions*

```

This finished the second pass. Now the third one begins, which loads the main language set with the key main. A warning is raised if the main language is not the same as the last named one, or if the value of the key main is not a language. With some options in provide, the package luatexbase is loaded (and immediately used), and therefore \babelprovide can't go inside a \DeclareOption; this explains why it's executed directly, with a dummy declaration. Then all languages have been loaded, so we deactivate \AfterBabelLanguage.

```

4299 \fi
4300 \</package>

```

In order to catch the case where the user didn't specify a language we check whether \bbl@main@language, has become defined. If not, the nil language is loaded.

6 The kernel of Babel (babel.def, common)

The kernel of the babel system is currently stored in babel.def. The file babel.def contains most of the code. The file hyphen.cfg is a file that can be loaded into the format, which is necessary when you want to be able to switch hyphenation patterns.

Because plain TeX users might want to use some of the features of the babel system too, care has to be taken that plain TeX can process the files. For this reason the current format will have to be checked in a number of places. Some of the code below is common to plain TeX and L^AT_EX, some of it is for the L^AT_EX case only.

Plain formats based on etex (etex, xetex, luatex) don't load hyphen.cfg but etex.src, which follows a different naming convention, so we need to define the babel names. It presumes language.def exists and it is the same file used when formats were created.

A proxy file for switch.def

```
4301 <*kernel>
4302 \let\bbl@onlyswitch\@empty
4303 \input babel.def
4304 \let\bbl@onlyswitch\@undefined
4305 </kernel>
4306 <*patterns>
```

7 Loading hyphenation patterns

The following code is meant to be read by iniTeX because it should instruct TeX to read hyphenation patterns. To this end the docstrip option patterns is used to include this code in the file hyphen.cfg. Code is written with lower level macros.

```
4307 <<Make sure ProvidesFile is defined>>
4308 \ProvidesFile{hyphen.cfg}[<<date>> v<<version>> Babel hyphens]
4309 \xdef\bbl@format{\jobname}
4310 \def\bbl@version{<<version>>}
4311 \def\bbl@date{<<date>>}
4312 \ifx\AtBeginDocument\@undefined
4313   \def\@empty{}
4314 \fi
4315 <<Define core switching macros>>
```

\process@line Each line in the file language.dat is processed by \process@line after it is read. The first thing this macro does is to check whether the line starts with =. When the first token of a line is an =, the macro \process@synonym is called; otherwise the macro \process@language will continue.

```
4316 \def\process@line#1#2 #3 #4 {%
4317   \ifx=#1%
4318     \process@synonym{#2}%
4319   \else
4320     \process@language{#1#2}{#3}{#4}%
4321   \fi
4322   \ignorespaces}
```

\process@synonym This macro takes care of the lines which start with an =. It needs an empty token register to begin with. \bbl@languages is also set to empty.

```
4323 \toks@{}
4324 \def\bbl@languages{}
```

When no languages have been loaded yet, the name following the = will be a synonym for hyphenation register 0. So, it is stored in a token register and executed when the first pattern file has been processed. (The \relax just helps to the \if below catching synonyms without a language.) Otherwise the name will be a synonym for the language loaded last. We also need to copy the hyphenmin parameters for the synonym.

```
4325 \def\process@synonym#1{%
4326   \ifnum\last@language=\m@ne
4327     \toks@\expandafter{\the\toks@\relax\process@synonym{#1}}%
4328   \else
4329     \expandafter\chardef\csname l@#1\endcsname\last@language
```

```

4330 \wlog{\string\l@#1=\string\language\the\last@language}%
4331 \expandafter\let\csname #1hyphenmins\expandafter\endcsname
4332 \csname\language\hyphenmins\endcsname
4333 \let\bbl@elt\relax
4334 \edef\bbl@languages{\bbl@languages\bbl@elt{#1}{\the\last@language}{}}%
4335 \fi}

```

`\process@language` The macro `\process@language` is used to process a non-empty line from the ‘configuration file’. It has three arguments, each delimited by white space. The first argument is the ‘name’ of a language; the second is the name of the file that contains the patterns. The optional third argument is the name of a file containing hyphenation exceptions.

The first thing to do is call `\addlanguage` to allocate a pattern register and to make that register ‘active’. Then the pattern file is read.

For some hyphenation patterns it is needed to load them with a specific font encoding selected. This can be specified in the file `language.dat` by adding for instance ‘:T1’ to the name of the language. The macro `\bbl@get@enc` extracts the font encoding from the language name and stores it in `\bbl@hyph@enc`. The latter can be used in hyphenation files if you need to set a behavior depending on the given encoding (it is set to empty if no encoding is given).

Pattern files may contain assignments to `\lefthyphenmin` and `\righthyphenmin`. T_EX does not keep track of these assignments. Therefore we try to detect such assignments and store them in the `\(lang)hyphenmins` macro. When no assignments were made we provide a default setting.

Some pattern files contain changes to the `\lccode` `\uccode` arrays. Such changes should remain local to the language; therefore we process the pattern file in a group; the `\patterns` command acts globally so its effect will be remembered.

Then we globally store the settings of `\lefthyphenmin` and `\righthyphenmin` and close the group.

When the hyphenation patterns have been processed we need to see if a file with hyphenation exceptions needs to be read. This is the case when the third argument is not empty and when it does not contain a space token. (Note however there is no need to save hyphenation exceptions into the format.)

`\bbl@languages` saves a snapshot of the loaded languages in the form

`\bbl@elt{<language-name>}{<number>}{<patterns-file>}{<exceptions-file>}`. Note the last 2

arguments are empty in ‘dialects’ defined in `language.dat` with =. Note also the language name can have encoding info.

Finally, if the counter `\language` is equal to zero we execute the synonyms stored.

```

4442 \input hyphen.tex\relax
4443 \chardef\l@english\z@
4444 \else

```

Pattern registers are allocated using count register \last@language. Its initial value is 0. The definition of the macro \newlanguage is such that it first increments the count register and then defines the language. In order to have the first patterns loaded in pattern register number 0 we initialize \last@language with the value -1.

```

4445 \last@language\m@ne

```

We now read lines from the file until the end is found. While reading from the input, it is useful to switch off recognition of the end-of-line character. This saves us stripping off spaces from the contents of the control sequence.

```

4446 \loop
4447 \endlinechar\m@ne
4448 \read1 to \bbl@line
4449 \endlinechar``^^M

```

If the file has reached its end, exit from the loop here. If not, empty lines are skipped. Add 3 space characters to the end of \bbl@line. This is needed to be able to recognize the arguments of \process@line later on. The default language should be the very first one.

```

4450 \if T\ifeof1F\fi T\relax
4451 \ifx\bbl@line\@empty\else

```

Here the code for `initex` ends.

8 Font handling with fontspec

Add the bidi handler just before `luaotfload`, which is loaded by default by LaTeX. Just in case, consider the possibility it has not been loaded. First, a couple of definitions related to bidi [misplaced].

```
4481 <<{*More package options}>> ≡
4482 \chardef\bbl@bidimode\z@
4483 \DeclareOption{bidi=default}{\chardef\bbl@bidimode=\@ne}
4484 \DeclareOption{bidi=basic}{\chardef\bbl@bidimode=101 }
4485 \DeclareOption{bidi=basic-r}{\chardef\bbl@bidimode=102 }
4486 \DeclareOption{bidi=bidi}{\chardef\bbl@bidimode=201 }
4487 \DeclareOption{bidi=bidi-r}{\chardef\bbl@bidimode=202 }
4488 \DeclareOption{bidi=bidi-l}{\chardef\bbl@bidimode=203 }
4489 </More package options>>
```

With explicit languages, we could define the font at once, but we don't. Just wait and see if the language is actually activated. `bbl@font` replaces hardcoded font names inside `\. . family` by the corresponding macro `\. . default`.

At the time of this writing, `fontspec` shows a warning about there are languages not available, which some people think refers to babel, even if there is nothing wrong. Here is hack to patch `fontspec` to avoid the misleading (and mostly useless) message.

```

9.2 Layout

Note elements like headlines and margins can be modified easily with packages like fancyhdr, typearea or titleps, and geometry.

\bbl@startskip and \bbl@endskip are available to package authors. Thanks to the T_EX expansion mechanism the following constructs are valid: \adim\bbl@startskip, \advance\bbl@startskip\adim, \bbl@startskip\adim.

Consider txtbabel as a shorthand for *tex-xet babel*, which is the bidi model in both pdftex and xetex.

9.4 LuaTeX

The loader for luatex is based solely on language.dat, which is read on the fly. The code shouldn't be executed when the format is build, so we check if \AddBabelHook is defined. Then comes a modified version of the loader in hyphen.cfg (without the hyphenmins stuff, which is under the direct control of babel).

The names \l@<language> are defined and take some value from the beginning because all ldf files assume this for the corresponding language to be considered valid, but patterns are not loaded (except the first one). This is done later, when the language is first selected (which usually means

when the ldf finishes). If a language has been loaded, \bbl@hyphendata@<num> exists (with the names of the files read).

The default setup preloads the first language into the format. This is intended mainly for ‘english’, so that it’s available without further intervention from the user. To avoid duplicating it, the following rule applies: if the “0th” language and the first language in language.dat have the same name then just ignore the latter. If there are new synonyms, they are added, but note if the language patterns have not been preloaded they won’t at run time.

Other preloaded languages could be read twice, if they have been preloaded into the format. This is not optimal, but it shouldn’t happen very often – with luatex patterns are best loaded when the document is typeset, and the “0th” language is preloaded just for backwards compatibility.

As of 1.1b, lua(e)tex is taken into account. Formerly, loading of patterns on the fly didn’t work in this format, but with the new loader it does. Unfortunately, the format is not based on babel, and data could be duplicated, because languages are reassigned above those in the format (nothing serious, anyway). Note even with this format language.dat is used (under the principle of a single source), instead of language.def.

Of course, there is room for improvements, like tools to read and reassign languages, which would require modifying the language list, and better error handling.

We need catcode tables, but no format (targeted by babel) provide a command to allocate them (although there are packages like ctblestack). FIX - This isn’t true anymore. For the moment, a dangerous approach is used - just allocate a high random number and cross the fingers. To complicate things, etex.sty changes the way languages are allocated.

This files is read at three places: (1) when plain.def, babel.sty starts, to read the list of available languages from language.dat (for the base option); (2) at hyphen.cfg, to modify some macros; (3) in the middle of plain.def and babel.sty, by babel.def, with the commands and other definitions for luatex (eg, \babelpatterns).

9.5 Southeast Asian scripts

First, some general code for line breaking, used by `\babelposthyphenation`. Replace regular (ie, implicit) discretionaries by spaceskips, based on the previous glyph (which I think makes sense, because the hyphen and the previous char go always together). Other discretionaries are not touched. See Unicode UAX 14.

9.6 CJK line breaking

Minimal line breaking for CJK scripts, mainly intended for simple documents and short texts as a secondary language. Only line breaking, with a little stretching for justification, without any attempt to adjust the spacing. It is based on (but does not strictly follow) the Unicode algorithm.

We first need a little table with the corresponding line breaking properties. A few characters have an additional key for the width (fullwidth vs. halfwidth), not yet used. There is a separate file, defined below.

```

5691 <<Font selection>>

```

9.9 Automatic fonts and ids switching

After defining the blocks for a number of scripts (must be extended and very likely fine tuned), we define a short function which just traverse the node list to carry out the replacements. The table `loc_to_scr` gets the locale from a script range (note the locale is the key, and that there is an intermediate table built on the fly for optimization). This locale is then used to get the `\language` and the `\localeid` as stored in `locale_props`, as well as the font (as requested). In the latter table a key starting with `/` maps the font from the global one (the key) to the local one (the value). Maths are skipped and discretionaries are handled in a special way.

```

Post-handling hyphenation patterns for non-standard rules, like ff to ff-f. There are still some issues with speed (not very slow, but still slow). The Lua code is below.

```

5852 \directlua{
5853   Babel.nohyphenation = \the\l@nohyphenation
5854 }

```

Now the T_EX high level interface, which requires the function defined above for converting strings to functions returning a string. These functions handle the {*n*} syntax. For example, pre={1}{1}- becomes function(*m*) return *m*[1]..*m*[1]..'-' end, where *m* are the matches returned after applying the pattern. With a mapped capture the functions are similar to function(*m*) return Babel.capt_map(*m*[1],1) end, where the last argument identifies the mapping to be applied to *m*[1]. The way it is carried out is somewhat tricky, but the effect is not dissimilar to lua load – save the code as string in a TeX macro, and expand this macro at the appropriate place. As \directlua does not take into account the current catcode of @, we just avoid this character in macro names (which explains the internal group, too).

```

9.11 Layout

Unlike xetex, luatex requires only minimal changes for right-to-left layouts, particularly in monolingual documents (the engine itself reverses boxes – including column order or headings –, margins, etc.) with `bidi=basic`, without having to patch almost any macro where text direction is relevant.

`\@hangfrom` is useful in many contexts and it is redefined always with the layout option.

There are, however, a number of issues when the text direction is not the same as the box direction (as set by `\bodydir`), and when `\parbox` and `\hangindent` are involved. Fortunately, latest releases of luatex simplify a lot the solution with `\shapemode`.

With the issue #15 I realized commands are best patched, instead of redefined. With a few lines, a modification could be applied to several classes and packages. Now, `tabular` seems to work (at least in simple cases) with `array`, `tabularx`, `hhline`, `colortbl`, `longtable`, `booktabs`, etc. However, `dcolumn` still fails.

```

OMEGA provided a companion to `\mathdir` (`\nextfake`) for those cases where we did not want it to be applied, so that the writing direction of the main text was left unchanged. `\bbl@nextfake` is an attempt to emulate it, because `luatex` has removed it without an alternative. Also, `\hangindent` does not honour direction changes by default, so we need to redefine `\@hangfrom`.

9.12 Lua: transforms

After declaring the table containing the patterns with their replacements, we define some auxiliary functions: `str_to_nodes` converts the string returned by a function to a node list, taking the node at base as a model (font, language, etc.); `fetch_word` fetches a series of glyphs and discretionaries, which pattern is matched against (if there is a match, it is called again before trying other patterns, and this is very likely the main bottleneck).

`post_hyphenate_replace` is the callback applied after `lang.hyphenate`. This means the automatic hyphenation points are known. As empty captures return a byte position (as explained in the `luatex` manual), we must convert it to a utf8 position. With `first`, the last byte can be the leading byte in a utf8 sequence, so we just remove it and add 1 to the resulting length. With `last` we must take into account the capture position points to the next character. Here `word_head` points to the starting node of the text to be matched.

```

9.13 Lua: Auto bidi with basic and basic-r

The file `babel-data-bidi.lua` currently only contains data. It is a large and boring file and it is not shown here (see the generated file), but here is a sample:

```

[0x25]={d='et'},
[0x26]={d='on'},
[0x27]={d='on'},
[0x28]={d='on', m=0x29},
[0x29]={d='on', m=0x28},
[0x2A]={d='on'},
[0x2B]={d='es'},
[0x2C]={d='cs'},

```

For the meaning of these codes, see the Unicode standard.

Now the `basic-r` bidi mode. One of the aims is to implement a fast and simple bidi algorithm, with a single loop. I managed to do it for R texts, with a second smaller loop for a special case. The code is still somewhat chaotic, but its behavior is essentially correct. I cannot resist copying the following text from Emacs `bidi.c` (which also attempts to implement the bidi algorithm with a single loop):

Arrrrgh!! The UAX#9 algorithm is too deeply entrenched in the assumption of batch-style processing [...]. May the fleas of a thousand camels infest the armpits of those who design supposedly general-purpose algorithms by looking at their own implementations, and fail to consider other possible implementations!

Well, it took me some time to guess what the batch rules in UAX#9 actually mean (in other word, *what* they do and *why*, and not only *how*), but I think (or I hope) I've managed to understand them. In some sense, there are two bidi modes, one for numbers, and the other for text. Furthermore, setting just the direction in R text is not enough, because there are actually *two* R modes (set explicitly in Unicode with RLM and ALM). In `babel` the `dir` is set by a higher protocol based on the language/script, which in turn sets the correct `dir` (`<l>`, `<r>` or `<al>`).

From UAX#9: “Where available, markup should be used instead of the explicit formatting characters”. So, this simple version just ignores formatting characters. Actually, most of that annex is devoted to how to handle them.

BD14-BD16 are not implemented. Unicode (and the W3C) are making a great effort to deal with some special problematic cases in “streamed” plain text. I don’t think this is the way to go – particular issues should be fixed by a high level interface taking into account the needs of the document. And here is where `luatex` excels, because everything related to bidi writing is under our control.

```

7052 <*basic-r>
7053 Babel = Babel or {}
7054
7055 Babel.bidi_enabled = true
7056
7057 require('babel-data-bidi.lua')
7058
7059 local characters = Babel.characters
7060 local ranges = Babel.ranges

```

```

7061
7062 local DIR = node.id("dir")
7063
7064 local function dir_mark(head, from, to, outer)
7065   dir = (outer == 'r') and 'TLT' or 'TRT' -- ie, reverse
7066   local d = node.new(DIR)
7067   d.dir = '+' .. dir
7068   node.insert_before(head, from, d)
7069   d = node.new(DIR)
7070   d.dir = '-' .. dir
7071   node.insert_after(head, to, d)
7072 end
7073
7074 function Babel.bidi(head, ispar)
7075   local first_n, last_n          -- first and last char with nums
7076   local last_es                  -- an auxiliary 'last' used with nums
7077   local first_d, last_d          -- first and last char in L/R block
7078   local dir, dir_real

```

Next also depends on script/lang (<al>/<r>). To be set by babel. tex.pardir is dangerous, could be (re)set but it should be changed only in vmode. There are two strong's – strong = l/al/r and strong_lr = l/r (there must be a better way):

```

7079   local strong = ('TRT' == tex.pardir) and 'r' or 'l'
7080   local strong_lr = (strong == 'l') and 'l' or 'r'
7081   local outer = strong
7082
7083   local new_dir = false
7084   local first_dir = false
7085   local inmath = false
7086
7087   local last_lr
7088
7089   local type_n = ''
7090
7091   for item in node.traverse(head) do
7092
7093     -- three cases: glyph, dir, otherwise
7094     if item.id == node.id'glyph'
7095       or (item.id == 7 and item.subtype == 2) then
7096
7097       local itemchar
7098       if item.id == 7 and item.subtype == 2 then
7099         itemchar = item.replace.char
7100       else
7101         itemchar = item.char
7102       end
7103       local chardata = characters[itemchar]
7104       dir = chardata and chardata.d or nil
7105       if not dir then
7106         for nn, et in ipairs(ranges) do
7107           if itemchar < et[1] then
7108             break
7109           elseif itemchar <= et[2] then
7110             dir = et[3]
7111             break
7112           end
7113         end
7114       end
7115       dir = dir or 'l'
7116       if inmath then dir = ('TRT' == tex.mathdir) and 'r' or 'l' end

```

Next is based on the assumption babel sets the language AND switches the script with its dir. We treat a language block as a separate Unicode sequence. The following piece of code is executed at the first glyph after a 'dir' node. We don't know the current language until then. This is not exactly true,

as the math mode may insert explicit dirs in the node list, so, for the moment there is a hack by brute force (just above).

```

7117     if new_dir then
7118         attr_dir = 0
7119         for at in node.traverse(item.attr) do
7120             if at.number == Babel.attr_dir then
7121                 attr_dir = at.value & 0x3
7122             end
7123         end
7124         if attr_dir == 1 then
7125             strong = 'r'
7126         elseif attr_dir == 2 then
7127             strong = 'al'
7128         else
7129             strong = 'l'
7130         end
7131         strong_lr = (strong == 'l') and 'l' or 'r'
7132         outer = strong_lr
7133         new_dir = false
7134     end
7135
7136     if dir == 'nsm' then dir = strong end          -- W1

```

Numbers. The dual <al>/<r> system for R is somewhat cumbersome.

```

7137     dir_real = dir          -- We need dir_real to set strong below
7138     if dir == 'al' then dir = 'r' end -- W3

```

By W2, there are no <en> <et> <es> if strong == <al>, only <an>. Therefore, there are not <et en> nor <en et>, W5 can be ignored, and W6 applied:

```

7139     if strong == 'al' then
7140         if dir == 'en' then dir = 'an' end          -- W2
7141         if dir == 'et' or dir == 'es' then dir = 'on' end -- W6
7142         strong_lr = 'r'          -- W3
7143     end

```

Once finished the basic setup for glyphs, consider the two other cases: dir node and the rest.

```

7144     elseif item.id == node.id'dir' and not inmath then
7145         new_dir = true
7146         dir = nil
7147     elseif item.id == node.id'math' then
7148         inmath = (item.subtype == 0)
7149     else
7150         dir = nil          -- Not a char
7151     end

```

Numbers in R mode. A sequence of <en>, <et>, <an>, <es> and <cs> is typeset (with some rules) in L mode. We store the starting and ending points, and only when anything different is found (including nil, ie, a non-char), the textdir is set. This means you cannot insert, say, a whatsit, but this is what I would expect (with luacolor you may colorize some digits). Anyway, this behavior could be changed with a switch in the future. Note in the first branch only <an> is relevant if <al>.

```

7152     if dir == 'en' or dir == 'an' or dir == 'et' then
7153         if dir ~= 'et' then
7154             type_n = dir
7155         end
7156         first_n = first_n or item
7157         last_n = last_es or item
7158         last_es = nil
7159     elseif dir == 'es' and last_n then -- W3+W6
7160         last_es = item
7161     elseif dir == 'cs' then          -- it's right - do nothing
7162     elseif first_n then -- & if dir = any but en, et, an, es, cs, inc nil
7163         if strong_lr == 'r' and type_n ~= '' then
7164             dir_mark(head, first_n, last_n, 'r')

```

```

7165     elseif strong_lr == 'l' and first_d and type_n == 'an' then
7166         dir_mark(head, first_n, last_n, 'r')
7167         dir_mark(head, first_d, last_d, outer)
7168         first_d, last_d = nil, nil
7169     elseif strong_lr == 'l' and type_n ~= '' then
7170         last_d = last_n
7171     end
7172     type_n = ''
7173     first_n, last_n = nil, nil
7174 end

```

R text in L, or L text in R. Order of dir_ mark's are relevant: d goes outside n, and therefore it's emitted after. See dir_mark to understand why (but is the nesting actually necessary or is a flat dir structure enough?). Only L, R (and AL) chars are taken into account – everything else, including spaces, whatsits, etc., are ignored:

```

7175 if dir == 'l' or dir == 'r' then
7176     if dir ~= outer then
7177         first_d = first_d or item
7178         last_d = item
7179     elseif first_d and dir ~= strong_lr then
7180         dir_mark(head, first_d, last_d, outer)
7181         first_d, last_d = nil, nil
7182     end
7183 end

```

Mirroring. Each chunk of text in a certain language is considered a “closed” sequence. If <r on r> and <l on l>, it's clearly <r> and <l>, resptly, but with other combinations depends on outer. From all these, we select only those resolving <on> → <r>. At the beginning (when last_lr is nil) of an R text, they are mirrored directly.

TODO - numbers in R mode are processed. It doesn't hurt, but should not be done.

```

7184 if dir and not last_lr and dir ~= 'l' and outer == 'r' then
7185     item.char = characters[item.char] and
7186         characters[item.char].m or item.char
7187 elseif (dir or new_dir) and last_lr ~= item then
7188     local mir = outer .. strong_lr .. (dir or outer)
7189     if mir == 'rrr' or mir == 'lrr' or mir == 'rrl' or mir == 'rlr' then
7190         for ch in node.traverse(node.next(last_lr)) do
7191             if ch == item then break end
7192             if ch.id == node.id'glyph' and characters[ch.char] then
7193                 ch.char = characters[ch.char].m or ch.char
7194             end
7195         end
7196     end
7197 end

```

Save some values for the next iteration. If the current node is 'dir', open a new sequence. Since dir could be changed, strong is set with its real value (dir_real).

```

7198 if dir == 'l' or dir == 'r' then
7199     last_lr = item
7200     strong = dir_real -- Don't search back - best save now
7201     strong_lr = (strong == 'l') and 'l' or 'r'
7202 elseif new_dir then
7203     last_lr = nil
7204 end
7205 end

```

Mirror the last chars if they are no directed. And make sure any open block is closed, too.

```

7206 if last_lr and outer == 'r' then
7207     for ch in node.traverse_id(node.id'glyph', node.next(last_lr)) do
7208         if characters[ch.char] then
7209             ch.char = characters[ch.char].m or ch.char
7210         end
7211     end
7212 end

```

```

7213 if first_n then
7214     dir_mark(head, first_n, last_n, outer)
7215 end
7216 if first_d then
7217     dir_mark(head, first_d, last_d, outer)
7218 end

```

In boxes, the dir node could be added before the original head, so the actual head is the previous node.

```

7219 return node.prev(head) or head
7220 end
7221 </basic-r>

```

And here the Lua code for bidi=basic:

```

10 Data for CJK

It is a boring file and it is not shown here (see the generated file), but here is a sample:

```
[0x0021]={c='ex'},
[0x0024]={c='pr'},
[0x0025]={c='po'},
[0x0028]={c='op'},
[0x0029]={c='cp'},
[0x002B]={c='pr'},
```

For the meaning of these codes, see the Unicode standard.

11 The ‘nil’ language

This ‘language’ does nothing, except setting the hyphenation patterns to nohyphenation.

For this language currently no special definitions are needed or available.

The macro `\LdfInit` takes care of preventing that this file is loaded more than once, checking the category code of the `@` sign, etc.

```
7646 <*nil>
7647 \ProvidesLanguage{nil}[<<date>>] v<<version>> Nil language]
7648 \LdfInit{nil}{datenil}
```

When this file is read as an option, i.e. by the `\usepackage` command, nil could be an ‘unknown’ language in which case we have to make it known.

```
7649 \ifx\l@nil\undefined
7650 \newlanguage\l@nil
7651 \@namedef{bbl@hyphendata@the\l@nil}{}}}% Remove warning
7652 \let\bbl@elt\relax
7653 \edef\bbl@languages{% Add it to the list of languages
7654   \bbl@languages\bbl@elt{nil}{the\l@nil}}}%
7655 \fi
```

This macro is used to store the values of the hyphenation parameters `\lefthyphenmin` and `\righthyphenmin`.

```
7656 \providehyphenmins{\CurrentOption}{\m@ne\m@ne}
```

The next step consists of defining commands to switch to (and from) the ‘nil’ language.

```
\captionnil
\datenil
7657 \let\captionnil\empty
7658 \let\datenil\empty
```

There is no locale file for this pseudo-language, so the corresponding fields are defined here.

```
7659 \def\bbl@inidata@nil{%
7660   \bbl@elt{identification}{tag.ini}{und}%
7661   \bbl@elt{identification}{load.level}{0}%

7684 \@namedef{bbl@sname@nil}{Latin}
7685 \@namedef{bbl@sbcpl@nil}{Latn}
7686 \@namedef{bbl@sotf@nil}{Latn}

```

The macro `\ldf@finish` takes care of looking for a configuration file, setting the main language to be switched on at `\begin{document}` and resetting the category code of `@` to its original value.

```

7687 \ldf@finish{nil}
7688 \nil

```

12 Calendars

The code for specific calendars are placed in the specific files, loaded when requested by an ini file in the identification section with `require.calendars`.

Start with function to compute the Julian day. It's based on the little library `calendar.js`, by John Walker, in the public domain.

```

7689 <(*Compute Julian day)> ≡
7690 \def\bbl@fpmo#1#2{(#1-#2*floor(#1/#2))}
7691 \def\bbl@cs@gregleap#1{%
7692   (\bbl@fpmo{#1}{4} == 0) &&
7693   (!((\bbl@fpmo{#1}{100} == 0) && (\bbl@fpmo{#1}{400} != 0)))}
7694 \def\bbl@cs@jd#1#2#3{% year, month, day
7695   \fp_eval:n{ 1721424.5 + (365 * (#1 - 1)) +
7696     floor((#1 - 1) / 4) + (-floor((#1 - 1) / 100)) +
7697     floor((#1 - 1) / 400) + floor((((365 * #2) - 362) / 12) +
7698     ((#2 <= 2) ? 0 : (\bbl@cs@gregleap{#1} ? -1 : -2)) + #3) }
7699 <(/Compute Julian day)>

```

12.1 Islamic

The code for the Civil calendar is based on it, too.

```

7700 <*ca-islamic>

```

The Umm al-Qura calendar, used mainly in Saudi Arabia, is based on moment-hijri, by Abdullah Alsigar (license MIT).

Since the main aim is to provide a suitable \today, and maybe some close dates, data just covers Hijri ~1435/~1460 (Gregorian ~2014/~2038).

```

13 Hebrew

This is basically the set of macros written by Michail Rozman in 1991, with corrections and adaption by Rama Porrat, Misha, Dan Haran and Boris Lavva. This must be eventually replaced by computations with l3fp. An explanation of what's going on can be found in `hebcsl.sty`

14 Persian

There is an algorithm written in TeX by Jabri, Abolhassani, Pournader and Esfahbod, created for the first versions of the FarsiTeX system (no longer available), but the original license is GPL, so its use with LPPPL is problematic. The code here follows loosely that by John Walker, which is free and accurate, but sadly very complex, so the relevant data for the years 2013-2050 have been pre-calculated and stored. Actually, all we need is the first day (either March 20 or March 21).

17 Support for Plain T_EX (plain.def)

17.1 Not renaming hyphen.tex

As Don Knuth has declared that the filename `hyphen.tex` may only be used to designate *his* version of the american English hyphenation patterns, a new solution has to be found in order to be able to load hyphenation patterns for other languages in a plain-based T_EX-format. When asked he responded:

That file name is “sacred”, and if anybody changes it they will cause severe upward/downward compatibility headaches.

People can have a file `locallyhyphen.tex` or whatever they like, but they mustn't diddle with `hyphen.tex` (or `plain.tex` except to preload additional fonts).

The files `bplain.tex` and `blplain.tex` can be used as replacement wrappers around `plain.tex` and `lplain.tex` to achieve the desired effect, based on the `babel` package. If you load each of them with `iniTEX`, you will get a file called either `bplain.fmt` or `blplain.fmt`, which you can use as replacements for `plain.fmt` and `lplain.fmt`.

As these files are going to be read as the first thing `iniTEX` sees, we need to set some category codes just to be able to change the definition of `\input`.

```

8100 <*bplain | blplain>
8101 \catcode\{=1 % left brace is begin-group character
8102 \catcode\}=2 % right brace is end-group character
8103 \catcode\#=6 % hash mark is macro parameter character

```

If a file called `hyphen.cfg` can be found, we make sure that *it* will be read instead of the file `hyphen.tex`. We do this by first saving the original meaning of `\input` (and I use a one letter control sequence for that so as not to waste multi-letter control sequence on this in the format).

```

8104 \openin 0 hyphen.cfg
8105 \ifeof0
8106 \else
8107 \let\input

```

Then `\input` is defined to forget about its argument and load `hyphen.cfg` instead. Once that's done the original meaning of `\input` can be restored and the definition of `\a` can be forgotten.

```
8108 \def\input #1 {%
8109   \let\input\a
8110   \a hyphen.cfg
8111   \let\a\undefined
8112 }
8113 \fi
8114 </bplain | bplain>
```

Now that we have made sure that `hyphen.cfg` will be loaded at the right moment it is time to load `plain.tex`.

```
8115 <bplain>\a plain.tex
8116 <bplain>\a lplain.tex
```

Finally we change the contents of `\fmtname` to indicate that this is *not* the plain format, but a format based on plain with the `babel` package preloaded.

```
8117 <bplain>\def\fmtname{babel-plain}
8118 <bplain>\def\fmtname{babel-lplain}
```

When you are using a different format, based on `plain.tex` you can make a copy of `blplain.tex`, rename it and replace `plain.tex` with the name of your format file.

17.2 Emulating some \LaTeX features

The file `babel.def` expects some definitions made in the $\text{\LaTeX} 2_{\epsilon}$ style file. So, in Plain we must provide at least some predefined values as well some tools to set them (even if not all options are available). There are no package options, and therefore an alternative mechanism is provided. For the moment, only `\babeloptionstrings` and `\babeloptionmath` are provided, which can be defined before loading `babel`. `\BabelModifiers` can be set too (but not sure it works).

```
8119 <(*Emulate LaTeX)> \equiv
8120 \def\@empty{}
8121 \def\loadlocalcfg#1{%
8122   \openin0#1.cfg
8123   \ifeof0
8124     \closein0
8125   \else
8126     \closein0
8127     {\immediate\write16{*****}%
8128      \immediate\write16{* Local config file #1.cfg used}%
8129      \immediate\write16{**}%
8130     }
8131     \input #1.cfg\relax
8132   \fi
8133   \@endofldf}
```

17.3 General tools

A number of \LaTeX macro's that are needed later on.

```

The following little macro `\in@` is taken from `latex.ltx`; it checks whether its first argument is part of its second argument. It uses the boolean `\in@`; allocating a new boolean inside conditionally executed code is not possible, hence the construct with the temporary definition of `\bbl@tempa`.

```

8279 \def\bbl@tempa{\csname newif\endcsname&ifin@}
8280 \catcode`\&=4
8281 \ifx\in@\@undefined

8286 \else
8287     \let\bbl@tempa\@empty
8288 \fi
8289 \bbl@tempa

```

\TeX has a macro to check whether a certain package was loaded with specific options. The command has two extra arguments which are code to be executed in either the true or false case. This is used to detect whether the document needs one of the accents to be activated (activegrave and activeacute). For plain \TeX we assume that the user wants them to be active by default. Therefore the only thing we do is execute the third argument (the code for the true case).

```

8290 \def\@ifpackagewith#1#2#3#4{#3}

```

The \TeX macro `\@ifl@aded` checks whether a file was loaded. This functionality is not needed for plain \TeX but we need the macro to be defined as a no-op.

```

8291 \def\@ifl@aded#1#2#3#4{}

```

For the following code we need to make sure that the commands `\newcommand` and `\providecommand` exist with some sensible definition. They are not fully equivalent to their $\TeX 2_{\epsilon}$ versions; just enough to make things work in plain \TeX environments.

```

8292 \ifx\@tempcnta\@undefined
8293     \csname newcount\endcsname\@tempcnta\relax
8294 \fi
8295 \ifx\@tempcntb\@undefined
8296     \csname newcount\endcsname\@tempcntb\relax
8297 \fi

```

To prevent wasting two counters in \TeX (because counters with the same name are allocated later by it) we reset the counter that holds the next free counter (`\count10`).

```

8298 \ifx\bye\@undefined

```

18 Acknowledgements

I would like to thank all who volunteered as β -testers for their time. Michel Goossens supplied contributions for most of the other languages. Nico Poppelier helped polish the text of the documentation and supplied parts of the macros for the Dutch language. Paul Wackers and Werenfried Spit helped find and repair bugs. During the further development of the babel system I received much help from Bernd Raichle, for which I am grateful. There are also many contributors for specific languages, which are mentioned in the respective files. Without them, babel just wouldn't exist.
